- - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   113 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9663345.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
```

```
     * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    113 Source(s);       3 Source Group(s); and      41
Receptor(s)

                with:      1 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    112 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   187.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.8 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
```

**Detailed Error/Message File: Covina Operation.err

**File for Summary of Results: Covina Operation.sum

```
 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   187.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.8 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Covina Operation.err

 **File for Summary of Results:   Covina Operation.sum

Appendix B

Biological Technical Study Memorandum

MEMORANDUM

To:	Kimberly Comacho, Covina Reliability Project, LLC
From:	Michael Cady, Senior Biologist
Subject:	Biological Technical Study Memorandum for the Covina Reliability Project
Date:	October 23, 2025
cc:	Chelsea Ohanesian, Dudek
Attachment(s):	Figures 1-1, 2-4 Attachment A: USFWS IPaC Search Results

Dudek is pleased to present Covina Reliability Project, LLC (Applicant) with our biological technical study memorandum for the Covina Reliability Project (Project). The Applicant has applied to the City of Covina, California (City) for approval for the development of a battery energy storage system (BESS) (Figure 1-1, Project Location).

The purpose of this biological technical study is to provide a desktop-level review of the Project site and identify any biological resources present at the Project site. No biological resources are present at the Project site. As further described below, the memorandum confirms that the Project will not result in significant impacts to biological resources based on the applicable thresholds of significance.

1 Methodology

This biological technical study provides a desktop-level review based on publicly available data obtained from satellite imagery, recent site photographs, and federal, state, and local electronic repositories. No fieldwork was performed as part of this effort. The following data sources were reviewed:

- California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CDFW 2025a)
- California Native Plant Society's Online Inventory of Rare and Endangered Vascular Plants (CNPS 2025)
- U.S. Fish and Wildlife Service's (USFWS) Information for Planning and Consultation (IPaC) (USFWS 2025a)
- CDFW Biogeographic Information and Observation System (BIOS) (CDFW 2025b)
- U.S. Geological Survey's National Hydrography Dataset (USGS 2025)
- USFWS Wetland Mapper online viewer (USFWS 2025b)
- U.S. Department of Agriculture Natural Resources Conservation Service's Web Soil Survey (USDA 2025)

2 Project Overview

The Project is designed to charge or discharge electricity to and from the grid via battery energy storage system (BESS) with associated on-site support components consisting of battery enclosures, inverters, collector lines, fencing, access roads, supervisory control, a SCADA system, and other ancillary facilities or equipment. The Project would also include an on-site Project substation on the west site that will allow interconnection to the adjacent SCE Cortez Substation via an overhead gen-tie line.

Utilizing similar battery technology used in electric vehicles, the Project would provide additional capacity to the electrical grid to assist with serving load during periods of peak demand by charging when demand is low and discharging when demand is high. This accommodates the integration of additional intermittent renewables such as wind and solar and reduces the need to operate natural gas power plants. The Project would also serve as an additional local capacity resource that would enhance grid reliability.

The Project site is located in the City of Covina (City), north of San Bernardino Freeway/Interstate (I) 10 and south of I-210, in the southeast portion of Los Angeles County (County). The City is approximately 15 miles east of the City of Los Angeles. The Project site is a developed industrial and commercial area, located south of East Edna Place and west of Barranca Avenue. The Project site is comprised of two sites (east and west), which total approximately 3.4 acres of private land, on APNs 8429-008-029, 8429-008-028, 8429-007-007, 8429-007-006 and 842-9-00-7-005.

As discussed above, the Project site comprises two sites (east and west), with a total area of approximately 3.4 acres of private land. Additionally, the Project will require work within the existing, fully developed, 1.32-acre Southern California Edison (SCE) Cortez Substation (APN 8429-008-800). The west site (APNs 8429-008-029 and 8429-008-028) is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses and associated surface parking. The east site (APNs 8429-007-007, 8429-007-006 and 8429-007-005) is developed with a surface parking lot where recreational and commercial vehicles and boats are currently stored (Figure 1-1, Project Location).

Project Substation

The Project substation would be the termination point of the 34.5-kilovolt (kV) medium voltage collection system. The power to and from the BESS would be passed through a final interconnection step-up transformer to convert it from 34.5kV to 66kV, which is the Project's interconnection voltage at the SCE Cortez Substation. The open-air Project substation would be on the southern portion of the west site adjacent to the SCE Cortez Substation as shown in the Preliminary Site Plan Improvements.

Generation Transmission and Collection Lines

Gen-Tie Line – West Site

The energy would be transported to and from the Project substation to the adjacent SCE Cortez Substation through a gen-tie line. The 66kV gen-tie line would be installed above ground from an approximately 50-foot point of change over (POCO) pole located within the Project substation, travel overhead approximately 90 feet into the SCE Cortez Substation, where it would connect to a 39-foot tall 66kV dead end switchyard structure, as described further below under SCE Cortez Substation Improvements. The 50-foot gen-tie POCO pole would be constructed of steel and would be at a height that is consistent with the existing equipment within the SCE Cortez Substation and the existing transmission lines along East Edna Place.

Collection Line

The Project would include a 34.5kV below-ground collection (feeder) line that would connect the east site to the west site and substation. As shown in Figure 1-1, Project Location, the collection line would extend from northeast

corner of the east site, west along the south side of East Edna Place within a portion of the public right-of-way approximately 600 feet before turning south and interconnecting with the Project substation.

SCE Cortez Substation Improvements

In order to facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. Below is a summary of improvements to the SCE Cortez Substation:

- Install facilities for a new 66kV switchrack position to terminate the Project's gen-tie line within the SCE
  - Cortez Substation. This work includes the following:
  - One (1) 39-foot tall 66kV dead end switchyard structure
  - Two (2) 66kV voltage transformers with steel pedestal support structures
  - Three (3) 66kV line drops
  - One (1) 66kV circuit breaker
  - Three (3) 66kV group operated disconnect switches, one with grounding equipment
  - Extend bus 1 position to the west within the SCE Cortez Substation fence line
  - 200 feet of conductor from the 39-foot tall 66kV dead end structure within the SCE Cortez Substation to the Project's point of change in ownership location outside SCE Cortez Substation fence line.
- Install telecommunications facilities:
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend fiber optic cable to the communications room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend the Project's diverse telecommunications into the communication room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
  - Lightwave, channel, and associated equipment (including terminal equipment), supporting protection, remote terminal unit and SCADA requirements at the Project and SCE Cortez Substation.

3 Existing Project Setting

The west site (APNs 8429-008-029 and 8429-008-028) is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses and associated surface parking. The east site (APNs 8429-007-007, 8429-007-006 and 8429-007-005) is developed with a surface parking lot where recreational and commercial vehicles and boats are currently stored.

The general area immediately surrounding the Project site includes similar commercial, manufacturing, and light industrial uses. Beyond this area to the west and north, there are multi-family residential uses and a senior center and park to the northwest beyond these uses. There is a railroad alignment immediately bordering the Project site

to the south, with commercial and institutional uses beyond this. The west site is bordered by the SCE Cortez Substation to the east (see Figure 1-1) and there are similar commercial, manufacturing, and light industrial uses beyond both sites. There are no trees or landscaping within the Project boundary; however, the adjacent SCE Cortez Substation site has several trees along the northern perimeter.

4 Environmental Information

The following is a brief summary of environmental information present at the Project site.

4.1 Special-Status Species

Dudek reviewed the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and federally designated critical habitat from the United States Fish and Wildlife Service (USFWS), within a 5-mile radius of the Project and SCE Cortez Substation to determine the potential for special-status wildlife and plant species to occur in the Project area (see Figure 2). USFWS IPaC search results for the Project site are provided in Attachment A.

Table 1. Special-Status Species with Records from the Project Vicinity

Common Name	Scientific Name	Status (Federal/State)	Occurrence Within 5 Miles	Overlap Project Boundaries
Plants				
Nevin's Barberry	*Berberis nevinii*	FE/1B.1	No	No
Slender-horned Spineflower	*Dodecahema leptoceras*	FE/1B.1	No	No
Chaparral Ragwort	*Senecio aphanactis*	None/2B.2	Yes	No
Greata's Aster	*Symphyotrichum greatae*	None/1B.3	Yes	No
Intermediate Mariposa-Lilly	*Calochortus weedii* var. *intermedius*	None/1B.2	Yes	No
Many-Stemmed Dudleya	*Dudleya multicaulis*	None/1B.2	Yes	No
Mesa Horkelia	*Horkelia cuneata* var. *puberula*	None/1B.1	Yes	No
Parry's Spineflower	*Chorizanthe parryi* var. *parryi*	None/1B.1	Yes	No
San Gabriel Mountains Dudleya	*Dudleya densiflora*	None/1B.1	Yes	No
Slender Mariposa-Lily	*Calochortus clavatus* var. *gracilis*	None/1B.2	Yes	No
Sonoran Maiden Fern	*Pelazoneuron puberulum* var. *sonorense*	None/2B.2	Yes	No

Status Legend

None: No Status

Federal

FE: Federally Listed as Endangered
FT: Federally Listed as Threatened
FPT: Federally Proposed for Listing as Threatened

State

C: Candidate Species
SE: State Listed as Endangered
SSC: Species of Special Concern

California Rare Plant Rank (CNPS 2025)

1B: Plants rare, threatened, or endangered in California and elsewhere
2B: Plants rare, threatened, or endangered in California but more common elsewhere

Threat Rank
0.1 – Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
0.2 – Moderately threatened in California (20%–80% occurrences threatened/moderate degree and immediacy of threat)
0.3 – Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

Suitable Habitat: No vegetation communities are mapped within the Project site (Figure 4; CALFIRE-FRAP 2015). Suitable habitat is not present for special-status or listed species at the Project site due to the developed nature of the Project site and surrounding area. The Project is within a highly urbanized area where all natural vegetation communities, soils, and hydrology have been removed or substantially altered. Furthermore, the upgrades to the SCE Cortez Substation will occur within areas previously disturbed and occupied by existing electrical facilities within and adjacent to the substation.

Critical Habitat: No critical habitat is designated within the Project boundary (USFWS 2025a).

USFWS Migratory Birds: The Project site does not provide suitable nesting habitat for migratory bird species; however, there could be potential for migratory birds in adjacent areas, such as the northern perimeter of the SCE Cortez Substation, and standard protections for nesting species protected by the Migratory Bird Treaty Act (MBTA) would need to be incorporated into the Project (USFWS 2025a).

4.2 Identification of Aquatic Resources

As shown in Figure 3, the Project site is located within the Los Angeles-San Gabriel River subarea unit (USGS 2025). The Project is within the jurisdiction of the Los Angeles Regional Water Quality Control Board (Region 4). The Project site is entirely developed and is covered with impervious surfaces. A review of the USFWS National Wetlands Inventory confirmed that there are no wetland features located within the Project site (Figure 3; USFWS 2025b). The Project site is located within an area of minimal flood hazard (Zone X), per the Federal Emergency Management Agency (FEMA) National Flood Hazard Layer Flood Insurance Rate Map panel for the area (Figure 3) (FEMA 2025).

The Clean Water Act prohibits the discharge of pollutants into waters of the U.S. without a National Pollutant Discharge Elimination System permit, which contains provisions to ensure that the discharge does not hurt water quality or the health of the public. These provisions include limits on what can be discharged and monitoring and reporting requirements. Construction projects that disturb more than one acre of soil require a Construction General Permit and are required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity. Under the Construction General Permit, the development of a Storm Water Pollution Prevention Plan (SWPPP) is required by a certified Qualified SWPPP Developer.

5 Summary

The Project site is a developed industrial site surrounded by other industrial and commercial urban developments. Upgrades to the SCE Cortez Substation as part of the Project will occur within areas previously disturbed and occupied by existing electrical facilities within and adjacent to the substation. No suitable habitat exists on site to support listed species; however, trees along the adjacent SCE Cortez Substation may provide suitable nesting habitat for migratory bird species. Compliance with MBTA regulations will be incorporated as part of the Project to avoid and minimize disturbances to nesting birds. Furthermore, there are no mapped jurisdictional waters within

the Project site. As such, development of the Project is anticipated to have no impact to sensitive biological resources.

Covina Reliability Project

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Los Angeles County, California

Local office

Carlsbad Fish And Wildlife Office

(760) 431-9440
(760) 431-5901

2177 Salk Avenue - Suite 250
Carlsbad, CA 92008-7385

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Birds

NAME	STATUS
Coastal California Gnatcatcher *Polioptila californica californica* Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8178	Threatened
Least Bell's Vireo *Vireo bellii pusillus* Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5945	Endangered

Reptiles

NAME	STATUS
Southwestern Pond Turtle *Actinemys pallida* Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4768	Proposed Threatened

Amphibians

NAME	STATUS
Western Spadefoot *Spea hammondii* Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/5425	Proposed Threatened

Insects

NAME	STATUS

NOT FOR CONSULTATION

NAME	STATUS
Monarch Butterfly Danaus plexippus Wherever found There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/9743	Proposed Threatened

Flowering Plants

NAME	STATUS
Nevin's Barberry Berberis nevinii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8025	Endangered
Slender-horned Spineflower Dodecahema leptoceras Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4007	Endangered

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

Bald & Golden Eagles

Bald and Golden Eagles are protected under the Bald and Golden Eagle Protection Act [2] and the Migratory Bird Treaty Act (MBTA) [1]. Any person or organization who plans or conducts activities that may result in impacts to Bald or Golden Eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate avoidance and minimization measures, as described in the various links on this page.

NOT FOR CONSULTATION

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

There are Bald Eagles and/or Golden Eagles in your project area.

Measures for Proactively Minimizing Eagle Impacts
For information on how to best avoid and minimize disturbance to nesting bald eagles, please review the National Bald Eagle Management Guidelines. You may employ the timing and activity-specific distance recommendations in this document when designing your project/activity to avoid and minimize eagle impacts. For bald eagle information specific to Alaska, please refer to Bald Eagle Nesting and Sensitivity to Human Activity.

The FWS does not currently have guidelines for avoiding and minimizing disturbance to nesting Golden Eagles. For site-specific recommendations regarding nesting Golden Eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

If disturbance or take of eagles cannot be avoided, an incidental take permit may be available to authorize any take that results from, but is not the purpose of, an otherwise lawful activity. For assistance making this determination for Bald Eagles, visit the Do I Need A Permit Tool. For assistance making this determination for golden eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

Ensure Your Eagle List is Accurate and Complete
If your project area is in a poorly surveyed area in IPaC, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to bald or golden eagles on your list, see the "Probability of Presence Summary" below to see when these bald or golden eagles are most likely to be present and breeding in your project area.

Review the FAQs

NOT FOR CONSULTATION

The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
Golden Eagle *Aquila chrysaetos* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12

(0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

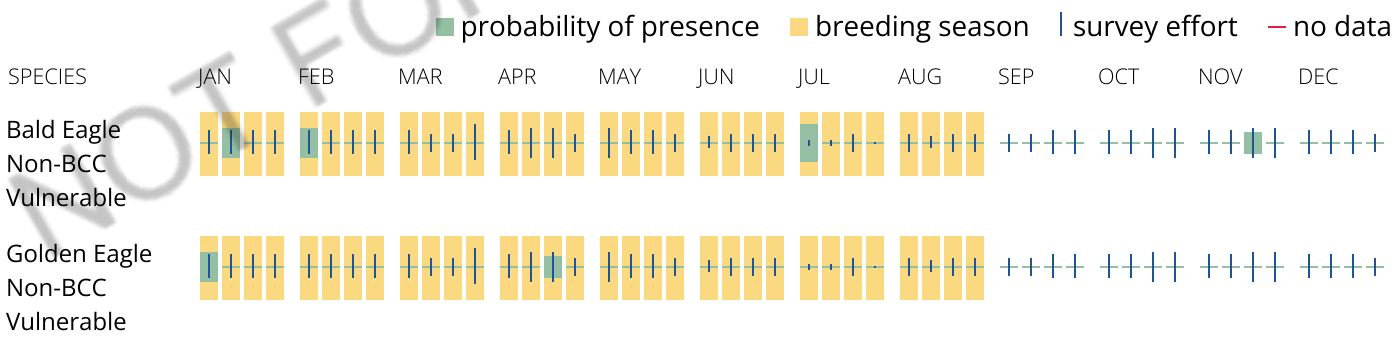
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION

Bald & Golden Eagles FAQs

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are an eagle (Bald and Golden Eagle Protection Act requirements may apply).

Proper interpretation and use of your eagle report

On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort line or no data line (red horizontal) means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide you in knowing when to implement avoidance and minimization measures to eliminate or reduce potential impacts from your project activities or get the appropriate permits should presence be confirmed.

How do I know if eagles are breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If an eagle on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

Interpreting the Probability of Presence Graphs

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:

The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()

Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()

A week is marked as having no data if there were no survey events for that week.

NOT FOR CONSULTATION

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory birds

The Migratory Bird Treaty Act (MBTA) [1] prohibits the take (including killing, capturing, selling, trading, and transport) of protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service (Service). The incidental take of migratory birds is the injury or death of birds that results from, but is not the purpose, of an activity. The Service interprets the MBTA to prohibit incidental take.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

Measures for Proactively Minimizing Migratory Bird Impacts

Your IPaC Migratory Bird list showcases birds of concern, including Birds of Conservation Concern (BCC), in your project location. This is not a comprehensive list of all birds found in your project area. However, you can help proactively minimize significant impacts to all birds at your project location by implementing the measures in the Nationwide avoidance and minimization measures for birds document, and any other project-specific avoidance and minimization measures suggested at the link Measures for avoiding and minimizing impacts to birds for the birds of concern on your list below.

Ensure Your Migratory Bird List is Accurate and Complete

If your project area is in a poorly surveyed area, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental

NOT FOR CONSULTATION

Information on Migratory Birds and Eagles document, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the "Probability of Presence Summary" below to see when these birds are most likely to be present and breeding in your project area.

Review the FAQs

The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31

Bullock's Oriole Icterus bullockii This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Mar 21 to Jul 25

NOT FOR CONSULTATION

California Gull Larus californicus — Breeds Mar 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Clark's Grebe Aechmophorus clarkii — Breeds Jun 1 to Aug 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Spinus lawrencei — Breeds Mar 20 to Sep 20

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Marbled Godwit Limosa fedoa — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Mountain Plover Charadrius montanus — Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3638

NOT FOR CONSULTATION

Northern Harrier Circus hudsonius — Breeds Apr 1 to Sep 15
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8350

Nuttall's Woodpecker Dryobates nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3914

Santa Barbara Song Sparrow Melospiza melodia graminea — Breeds Mar 1 to Sep 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/5513

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Western Grebe aechmophorus occidentalis — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/6743

Western Gull Larus occidentalis — Breeds Apr 21 to Aug 25
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Western Screech-owl Megascops kennicottii cardonensis — Breeds Mar 1 to Jun 30
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

NOT FOR CONSULTATION

Wrentit *Chamaea fasciata* Breeds Mar 15 to Aug 10

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (■)

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

NOT FOR CONSULTATION

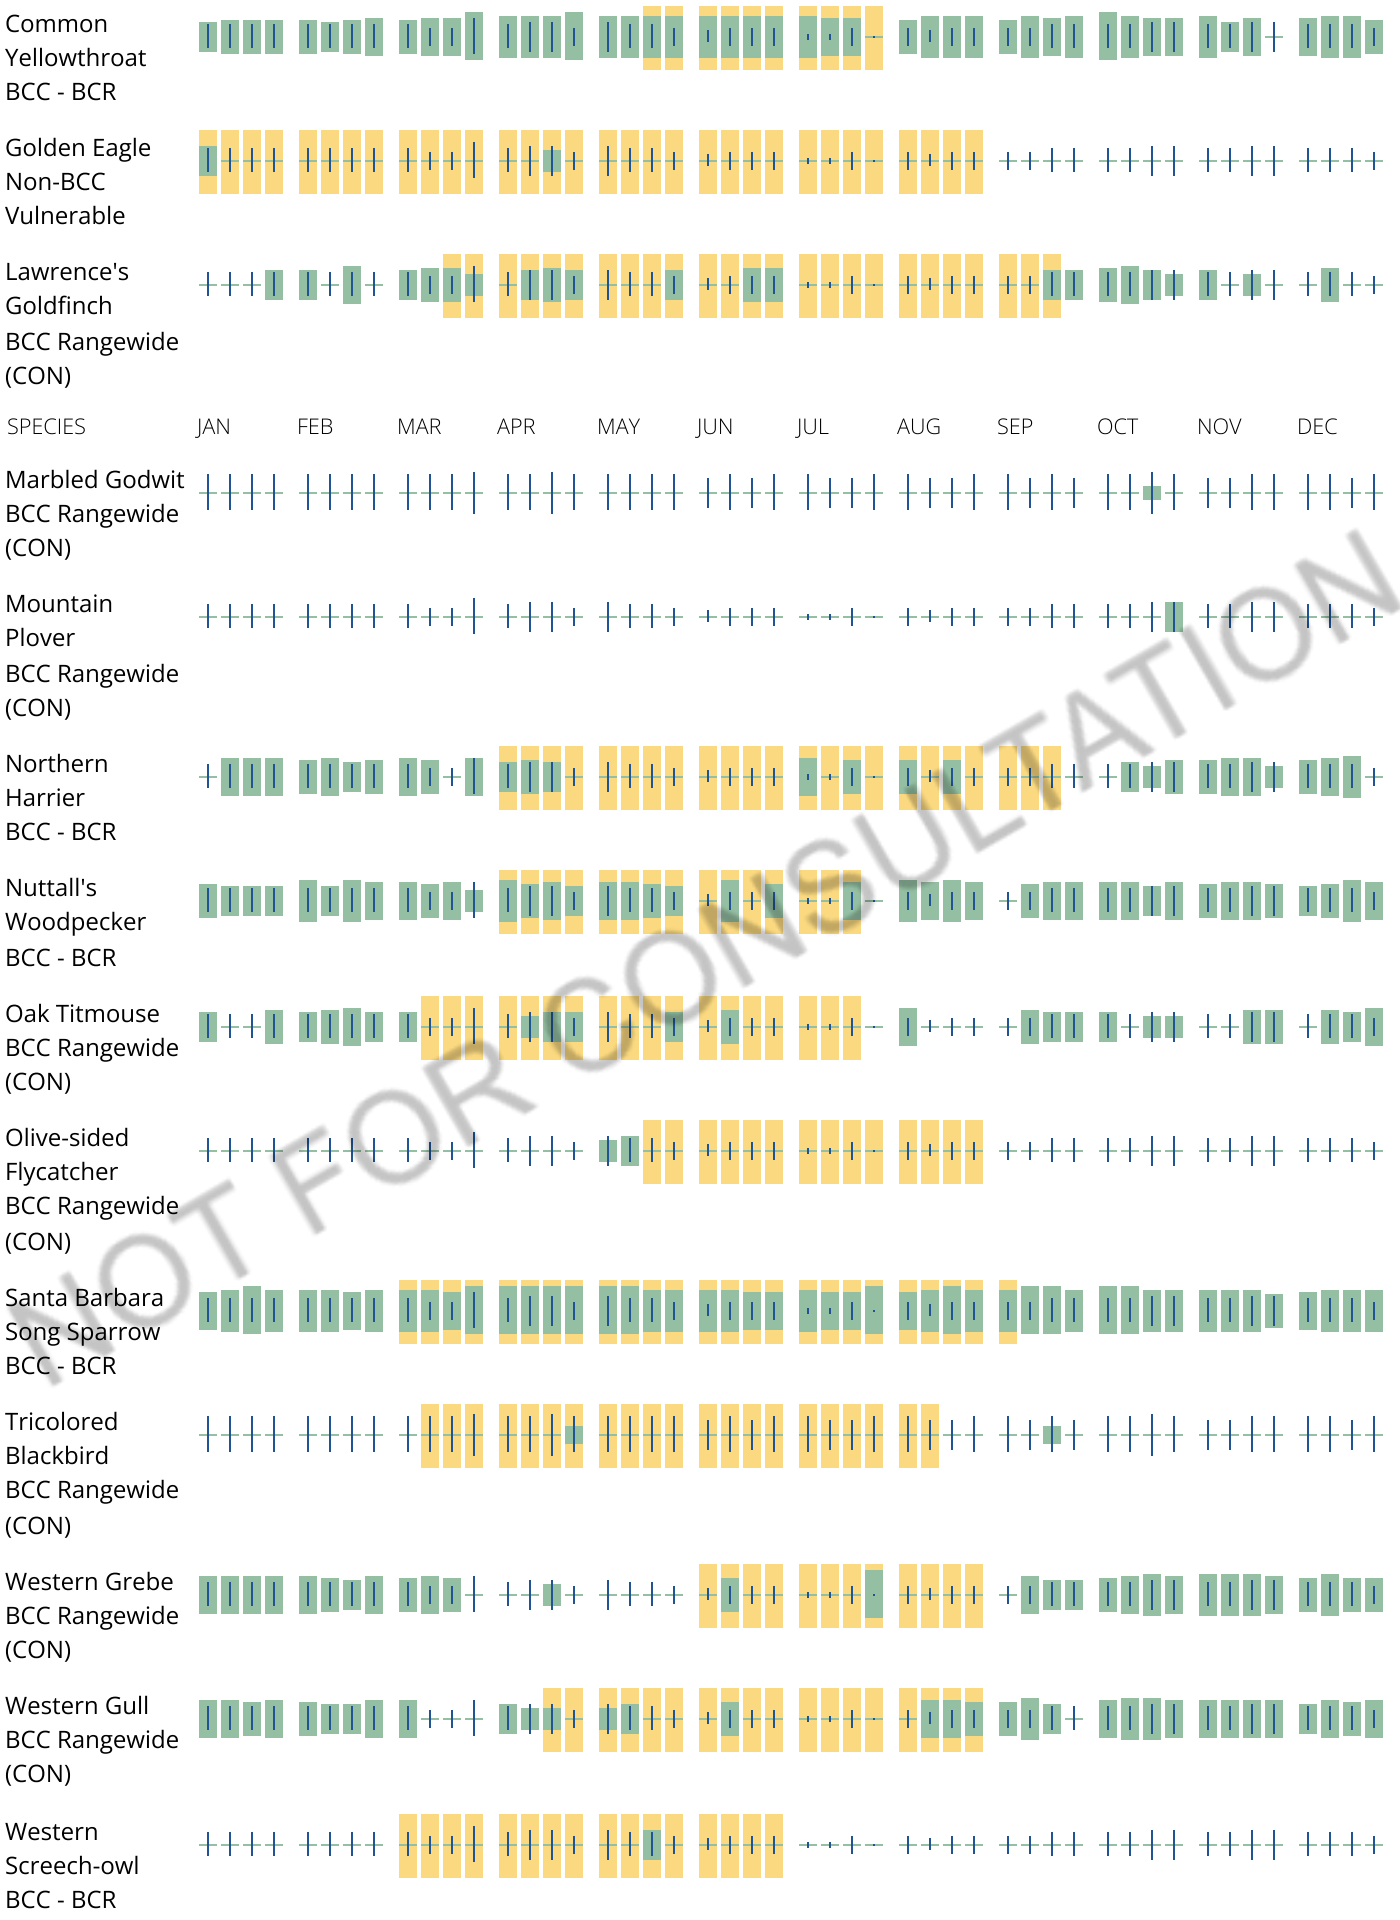
Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

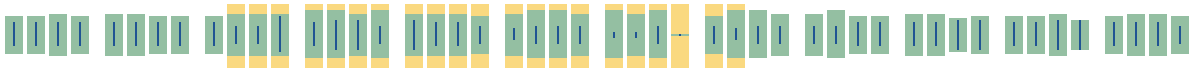
No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION



NOT FOR CONSULTATION



Migratory Bird FAQs

Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Avoidance & Minimization Measures for Birds describes measures that can help avoid and minimize impacts to all birds at any location year-round. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is one of the most effective ways to minimize impacts. To see when birds are most likely to occur and breed in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location, such as those listed under the Endangered Species Act or the Bald and Golden Eagle Protection Act and those species marked as "Vulnerable". See the FAQ "What are the levels of concern for migratory birds?" for more information on the levels of concern covered in the IPaC migratory bird species list.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) with which your project intersects. These species have been identified as warranting special attention because they are BCC species in that area, an eagle (Bald and Golden Eagle Protection Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, and to verify survey effort when no results present, please visit the Rapid Avian Information Locator (RAIL) Tool.

Why are subspecies showing up on my list?

Subspecies profiles are included on the list of species present in your project area because observations in the AKN for **the species** are being detected. If the species are present, that means that the subspecies may also be present. If a subspecies shows up on your list, you may need to rely on other resources to determine if that subspecies may be present (e.g. your local FWS field office, state surveys, your own surveys).

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

NOT FOR CONSULTATION

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go to the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Bald and Golden Eagle Protection Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially BCC species. For more information on avoidance and minimization measures you can implement to help avoid and minimize migratory bird impacts, please see the FAQ “Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds”.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Proper interpretation and use of your migratory bird report

NOT FOR CONSULTATION

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list does not represent all birds present in your project area. It is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide implementation of avoidance and minimization measures to eliminate or reduce potential impacts from your project activities, should presence be confirmed. To learn more about avoidance and minimization measures, visit the FAQ "Tell me about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds".

Interpreting the Probability of Presence Graphs
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:
The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe

NOT FOR CONSULTATION

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Facilities

Wildlife refuges and fish hatcheries

Refuge and fish hatchery information is not available at this time

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

This location did not intersect any wetlands mapped by NWI.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

NOT FOR CONSULTATION

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Printed on 30% post-consumer recycled material.

Acknowledgments

Primary Report Authors: This report was prepared by Katie Ahmanson, MHC, who meets the Secretary of the Interior's Professional Qualification Standards for architectural history.

Report Contributions: The report was also prepared with contributions from Senior Architectural Historian Patricia Ambacher, MA, who provided a senior-level review of the report. Ms. Ambacher meets the Secretary of the Interior's Professional Qualifications Standards for architectural history and history.

Team Support: Nathan Reid, GIS analyst, managed the geographic information system data and created the figures in the report.

Intended Use: This report is intended for the Client's and its representatives' exclusive use. Based on the results of Dudek's investigation, it contains professional conclusions and recommendations concerning the potential for Project-related impacts to cultural resources. It should not be considered to constitute Project clearance with regard to the treatment of cultural resources or permission to proceed with the Project described in lieu of review by the appropriate reviewing or permitting agency. This report should be submitted to the appropriate federal, state, and local review agencies for their comments prior to the commencement of the Project.

INTENTIONALLY LEFT BLANK

Executive Summary

Dudek prepared a built environment inventory and evaluation report for the proposed Covina Reliability Project (Project) in Covina, California. The Project site is comprised of two sites (east and west), which total approximately 3.4 acres of private land[1]. The Project site consists of five parcels at 534 East Edna Place (Assessor Parcel Number [APN] 8429-008-028), 522 East Edna Place (APN 8429-008-029), and APNs 8429-007-007, 8429-007-006, and 8429-007-005. The Project site includes two historic-age properties at 534 East Edna Place (APN 8429-008-028) and 522 East Edna Place (APN 8429-008-029). The Project includes the construction and operation of a battery energy storage system at 534 East Edna Place (APN 8429-008-028), which would connect to the existing and adjacent Southern California Edison (SCE) Cortez Substation at 578 East Edna Place (APN 8429-008-800) via a generation transmission line. To facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. The west site is bordered directly to the east by the 1.32-acre SCE Cortez Substation on APN 8429-008-800, which occupies approximately 1.32 acres and is developed with electrical distribution infrastructure within a fenced and previously disturbed area. The SCE Cortez Substation is considered an off-site impact area associated with the Project, and therefore, is included in the area of potential impacts (API). The API is the study area delineated to assess potential impacts from the construction and operation of the Project on historic built environment resources. The API encompasses the geographic areas within which the Project may directly or indirectly cause a substantial adverse change in the significance of a known or unknown historical resource.

This report documents Dudek's efforts to identify and evaluate built environment cultural resources consistent with the requirements of the California Environmental Quality Act. These efforts included a records search of the California Historical Resources Information System; the development of a study area or area of potential impacts (API); an intensive-level survey of the API for built resources of historic age (45 years of age or older); building development and archival research; the creation of an appropriate historic context; and recordation and evaluation of historic-era properties located in the API under National Register of Historic Places, California Register of Historical Resources, and City of Covina Historic Resources Inventory designation criteria.

Dudek's archival research and field survey identified three historic-era properties in the API, at 534 East Edna Place (APN 8429-008-028) and 522 East Edna Place (APN 8429-008-029) within the Project site, and at the adjacent SCE Cortez Substation at 578 East Edna Place (APN 8429-008-800), within the off-site impact area. Dudek concludes that none of the subject properties are eligible for listing in the National Register of Historic Places, California Register of Historical Resources, or the City of Covina Historic Resources Inventory due to a lack of significant associations and architectural merit. The recommended California Historical Resource Status code for the three properties is 6Z, meaning it was found ineligible for the National Register of Historic Places, California Register of Historical Resources, or the City of Covina Historic Resources Inventory through survey evaluation. Because there are no historical resources, the proposed Project would cause No Impact to historic-era buildings in the Project site or the off-site impact area under the California Environmental Quality Act.

[1] West site is approximately 1.34 acres and east site is approximately 2.07 acres for a total of approximately 3.4 acres, rounded.

INTENTIONALLY LEFT BLANK

1 Introduction

This built environment inventory and evaluation report documents the identification and evaluation of built environment cultural resources within or adjacent to the proposed Covina Reliability Project (Project) site that may require additional analysis for compliance under the California Environmental Quality Act (CEQA). This report includes the following components: (1) an introduction including Project location, description, the area of potential impacts (API), and the regulatory context; (2) background research, which includes a focused records search review of previously recorded built environment resources included in the California Historical Resources Information System (CHRIS), a review of primary and secondary sources, summary of interested parties consultation, and the field methodology; (3) the development of an applicable historic context for the Project area; (4) an evaluation of significance for all resources within the API; (5) findings and conclusions; and (6) references cited.

1.1 Project Location

The proposed Project is located within Sections 12 of Township 1 South and Ranges 9 West and 10 West of the *Baldwin Park*, California USGS 7.5 Minute Series Quadrangle (Figure 1-1: Project Location). The Project site is in Los Angeles County, approximately 15 miles east of the City of Los Angeles, in the City of Covina. The Project site is comprised of two sites (east and west), which total approximately 3.4 acres of private land. The west site (APNs 8429-008-029 and 8429-008-028) is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses and associated surface parking. It is bordered directly to the east by the 1.32-acre SCE Cortez Substation on APN 8429-008-800.The east site (APNs 8429-007-007, 8429-007-006 and 8429-007-005) is developed with a surface parking lot where recreational and commercial vehicles and boats are stored. The general area immediately surrounding the Project site includes similar commercial, manufacturing, and light industrial uses. Beyond this area to the west and north, there are multi-family residential uses, and a senior center and park to the northwest beyond these uses. There is a railroad alignment immediately bordering the Project site to the south, with commercial and institutional uses beyond this. The west site is bordered by the SCE Cortez Substation to the east with similar commercial, manufacturing, and light industrial uses beyond both sites.

1.2 Project Description

The Project is designed to charge or discharge electricity to and from the grid via battery energy storage system (BESS) with associated on-site support components consisting of battery enclosures, inverters, collector lines, fencing, access roads, supervisory control, a SCADA system, and other ancillary facilities or equipment. The Project would also include an on-site Project substation on the west site that will allow interconnection to the adjacent SCE Cortez Substation via an overhead gen-tie line.

Utilizing similar battery technology used in electric vehicles, the Project would provide additional capacity to the electrical grid to assist with serving load during periods of peak demand by charging when demand is low and discharging when demand is high. This accommodates the integration of additional intermittent renewables such as wind and solar and reduces the need to operate natural gas power plants. The Project would also serve as an additional local capacity resource that would enhance grid reliability.

The Project is expected to create approximately 40 jobs during construction, many of which can be sourced from the City and adjacent cities. The Project would be operated remotely, with weekly visits by one to two workers in a

light utility truck for routine inspections. Periodic on-site maintenance, including occasional equipment replacement and electrical repairs, would be performed as needed by regional employees and contractors.

Battery Energy Storage System

The Project would include placement of battery energy storage enclosures and associated electrical equipment, including medium voltage transformers and power conversation systems. Each unit consists of a storage enclosure/non-occupiable steel cabinet that houses battery modules and power conversion system equipment. The battery storage units are prefabricated off site and arrive to the site fully assembled and ready to be installed and operated. The actual number of energy storage enclosures and types are approximate and subject to change based on available battery technology at the time of construction. Each battery energy storage enclosure would have insulation, a module cooling system, a battery management system, fire detection equipment, power conversion system (PCS) equipment containing the electronic controls, inverters, and a medium voltage step-up transformer. The primary storage components would consist of self-contained electrochemical battery systems using conventional storage technologies with proven safety and performance records. The BESS enclosures would be designed such that the periodic maintenance and replacement of underperforming battery components can be easily performed on an as-needed basis without replacing the entire module.

Project Substation

The Project substation would be the termination point of the 34.5-kilovolt (kV) medium voltage collection system. The power to and from the BESS would be passed through a final interconnection step-up transformer to convert it from 34.5kV to 66kV, which is the Project's interconnection voltage at the SCE Cortez Substation. The open-air Project substation would be on the southern portion of the west site adjacent to the SCE Cortez Substation as shown in the Preliminary Site Plan Improvements.

Generation Transmission and Collection Lines

Gen-Tie Line – West Site

The energy would be transported to and from the Project substation to the adjacent SCE Cortez Substation through a gen-tie line. The 66kV gen-tie line would be installed above ground from an approximately 50-foot point of change over (POCO) pole located within the Project substation, travel overhead approximately 90 feet into the SCE Cortez Substation, where it would connect to a 39-foot tall 66kV dead end switchyard structure, as described further below under SCE Cortez Substation Improvements. The 50-foot gen-tie POCO pole would be constructed of steel and would be at a height that is consistent with the existing equipment within the SCE Cortez Substation and the existing transmission lines along East Edna Place.

Collection Line

The Project would include a 34.5kV below-ground collection (feeder) line that would connect the east site to the west site and substation. As shown in Figure 1-1, Project Location, the collection line would extend from northeast corner of the east site, west along the south side of East Edna Place within a portion of the public right-of-way approximately 600 feet before turning south and interconnecting with the Project substation.

SCE Cortez Substation Improvements

In order to facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. Below is a summary of improvements to the SCE Cortez Substation:

- Install facilities for a new 66kV switchrack position to terminate the Project's gen-tie line within the SCE Cortez Substation. This work includes the following:
  - One (1) 39-foot tall 66kV dead end switchyard structure
  - Two (2) 66kV voltage transformers with steel pedestal support structures
  - Three (3) 66kV line drops
  - One (1) 66kV circuit breaker
  - Three (3) 66kV group operated disconnect switches, one with grounding equipment
  - Extend bus 1 position to the west within the SCE Cortez Substation fence line
  - 200 feet of conductor from the 39-foot tall 66kV dead end structure within the SCE Cortez Substation to the Project's point of change in ownership location outside SCE Cortez Substation fence line.
- Install telecommunications facilities:
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend fiber optic cable to the communications room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend the Project's diverse telecommunications into the communication room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
  - Lightwave, channel, and associated equipment (including terminal equipment), supporting protection, remote terminal unit and SCADA requirements at the Project and SCE Cortez Substation.

Project Location

Covina Reliability Project

1.3 Regulatory Setting

The following sections provide a brief overview of the federal and state regulatory framework through which historic properties and historical resources are identified and evaluated. While the Project as currently planned is subject only to state and local regulatory conditions, federal regulations are also provided here for reference should they be relevant in the future.

1.3.1 Federal

National Historic Preservation Act (54 USC 300101 et seq., including Section 106 of the National Historic Preservation Act, 54 USC 306108)

The National Historic Preservation Act established the National Register of Historic Places (NRHP) and the Advisory Council on Historic Preservation. Under the act, significant cultural resources are referred to as historic properties, which include any prehistoric or historic district, site, building, structure, or object included in, or determined eligible for inclusion in, the NRHP. Historic properties that are designated by the Secretary of the Interior to be National Historic Landmarks are nationally significant historic places that possess exceptional value or quality in illustrating or interpreting the heritage of the United States. A property is considered historically significant if it meets one of the NRHP criteria and retains sufficient historic integrity to convey its significance.

Implementing Regulations for Section 106 of the National Historic Preservation Act (Title 36 Code of Federal Regulations Part 800)

Section 106 of the National Historic Preservation Act requires federal agencies to consider the effects of their undertakings on historic properties. The Section 106 process consists of four principal steps: (1) initiation of the Section 106 process, which includes identifying and initiating consultation with Native American tribes, local governments, and other interested parties; (2) identification of historic properties; (3) assessment of adverse effects; and (4) delineation of stipulations to resolve adverse effects in an agreement document.

Section 106 affords the Advisory Council on Historic Preservation and the State Historic Preservation Officer, as well as other consulting parties, a reasonable opportunity to comment on any project that would adversely affect historic properties. The Advisory Council on Historic Preservation is an independent administering agency that develops procedures at the federal level to protect cultural resources included in, or eligible for inclusion in, the NRHP. The State Historic Preservation Officers administer the national historic preservation program at the state level, in addition to reviewing NRHP nominations, maintaining data on historic properties, and consulting with federal agencies during the Section 106 review.

The NRHP criteria for evaluation (Title 36 Code of Federal Regulations Section 60.4) consider the quality of significance in American history, architecture, archaeology, engineering, and culture in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and that:

A. Are associated with events that have made a significant contribution to the broad patterns of our history
B. Are associated with the lives of persons significant in our past

C. Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction

D. Have yielded or may be likely to yield, information important in prehistory or history

To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity. Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. In addition to meeting at least one of the significance criteria discussed above, the assessment of integrity requires consideration under the following seven aspects or qualities: location, design, materials, workmanship, setting, feeling, and association. To retain integrity, a property will always possess several, and generally most, of these aspects (NPS 1995:44).

Certain properties are not typically considered for listing in the NRHP: religious properties, moved properties, birthplaces and graves, cemeteries, reconstructed properties, commemorative properties, and properties achieving significance within the past 50 years. These properties may be eligible for listing in the NRHP if the property meets one of the four criteria listed above and if the property also meets the appropriate Criteria Consideration for the property.

1.3.2 State

California Environmental Quality Act (California Public Resources Code, Section 21083.2) and California Environmental Quality Act Guidelines (14 CCR 15064.5)

CEQA requires that the lead agency consider the impacts of a project on historical resources. California Public Resources Code (PRC), Section 21084.1, defines historical resources as those listed, or eligible for listing, in the California Register of Historical Resources (CRHR), or those officially designated or recognized as historically significant by a local government pursuant to a local county or city ordinance or jurisdiction, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. Historical resources also include "historic properties" in California that are listed, or determined eligible for listing, in the NRHP and CRHR. The CEQA Guidelines provide specific guidance for determining the significance of impacts on historical resources. As described in in Section 15064.5(b) of the CEQA Guidelines, a "project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment."

- A "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (Section 15064.5[b][1]).
- The significance of a historical resource is materially impaired when a project would do one or more of the following:
  - Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR (Section 15064.5[b][2][A])

- Demolishes or materially alters in an adverse manner those physical characteristics that account for it inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the California PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of the evidence that the resource is not historically or culturally significant (Section 15064.5[b][2][B])
- Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historic significance and that justify its inclusion in the CRHR as determined by a lead agency for purposes of CEQA (Section 15064.5[b][2][C])

The CEQA Guidelines also provide guidance on minimizing or avoiding significant adverse impacts on historical resources as outlined in the following provisions of Section 15064.5(b)(3)–(5).

- Generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historical resource (Section 15064.5[b][3]).
- A lead agency shall identify potentially feasible measures to mitigate significant adverse changes in the significance of an historical resource. The lead agency shall ensure that any adopted measures to mitigate or avoid significant adverse changes are fully enforceable through permit conditions, agreements, or other measures (Section 15064.5[b][4]).
- When a project will affect state-owned historical resources, as described in California PRC Section 5024, and the lead agency is a state agency, the lead agency shall consult with the State Historic Preservation Officer as provided in California PRC Section 5024.5. Consultation should be coordinated in a timely fashion with the preparation of the environmental documents (Section 15064.5[b][5]).

California Register of Historical Resources (California Public Resources Code Section 5024.1 and 14 CCR 4850)

PRC Section 5024.1 establishes the CRHR, which lists all significant resources in California that are considered to be historical resources. In California, the term "historical resource" includes, but is not limited to, "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1[j]). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). The criteria for listing resources in the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP. As such, a resource is considered historically significant if it meets at least one of the following criteria outlined under PRC Section 5024.1(c):

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Is associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one of the significance criteria described in PRC Section 5024.1(c), a resource must also possess sufficient integrity to qualify for listing in the CRHR. Integrity as defined in Title 14 of the California Code of Regulations (CCR), Section 4852(c), as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance" as evaluated with regard to the resource's retention of location, design, setting, materials, workmanship, feeling, and association. Historical resources that lack sufficient integrity to meet the criteria for listing in the NRHP may still be eligible for listing in the CRHR if they have the potential to yield significant scientific or historical information or specific data. The CRHR has three special considerations for resources described under 14 CCR 4852(d).

The CRHR includes not only listed prehistoric and historic cultural resources but also resources that are identified through local historical resource surveys or designated under local ordinances, provided the survey and ordinance meet the criteria in 14 CCR 4852(e) and (f).

1.3.3 Local Regulations

City of Covina Municipal Code – Section 17.81.050 Historic Designation Criteria

Chapter 17.81 of the City of Covina (City) Municipal Code, also known as the City's Historic Preservation Ordinance, establishes the eligibility criteria for landmarks and historic districts within Covina. Ordinance Chapter 17.81 states that any archaeological site, natural feature, or property that has special historical, cultural, aesthetic, or architectural character, interest, or value as part of the development, heritage, or history of the City of Covina is eligible for local designation if they meet any or all of the following criteria:

1. It exemplifies or reflects special elements of the city's cultural, social, economic, political, aesthetic, engineering, architectural or natural history; or
2. It is identified with persons or events significant in local, state, or national history; or
3. It represents the work of a notable builder, designer, or architect; or
4. It embodies distinctive characteristics of a style, type, period, or method of construction, or is a valuable example of the use of indigenous materials or craftsmanship; or
5. It contributes to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development; or
6. It is one of the few remaining examples in the city of Covina, region, state, or nation possessing distinguishing characteristics of an architectural or historic type or specimen.

1.4 Area of Potential Impacts

The API is the study area delineated to assess potential impacts from the construction and operation of the Project on both archaeological and historic built environment resources. The API for built environment resources encompasses the geographic area or areas within which the Project may directly or indirectly cause a substantial adverse change in the significance of a known or unknown historical resource. A substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource is materially impaired (14 CCR 15064.5[b][1]). Under CEQA, material impairment of a historical resource is considered a significant impact (or effect), which can be direct, indirect, or cumulative.[2]

A direct or primary effect on a historical resource is one that is caused by the Project and occurs at the same time and place (14 CCR 15358[a][1]). Examples of direct effects that are caused by, and immediately related to, the Project include, but are not limited to, demolition, destruction, relocation, and alteration of a historical resource from ground disturbance or other construction activities. Direct effects, however, are not limited to physical effects and, in certain circumstances, can be visual, vibratory, auditory, or atmospheric in nature if the effect is immediate and it results in the material impairment of the significance of a historical resource. Visual intrusions within the viewshed of a historical resource, for example, could result in the material impairment of the resource's integrity of setting if an unencumbered view of the surrounding area or a specific area is a characteristic that contributes to the significance of the resource. Similarly, operational noise that exceeds the ambient level of a sensitive noise receptor can cause material impairment to a historical resource that derives part or all its significance from an inherently quiet auditory setting.[3] Finally, atmospheric intrusions, such as those caused by the introduction of high levels of fugitive dust emissions or chemical pollutants, can result in adverse effects that directly and physically affect biological landscape features that have been identified as historical resources for the purposes of CEQA. Overall, while direct effects clearly include physical effects, they may also include other types of effects that are visual, vibratory, auditory, or atmospheric in nature if the effect is caused by and occurs at the same time and place as the Project and there is no other intervening cause between the activities or components of the Project and the historical resource.

By contrast, an indirect or secondary effect is a reasonably foreseeable effect caused by the Project that occurs later in time or is farther removed in distance. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems (14 CCR 15358[a][2]). Because these types of effects are not immediately related to the Project, they are considered secondary effects.

Cumulative impacts refer to two or more individual effects that, when considered together, are considerable or compound or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the Project when added to other closely related past,

[2] As used in the CEQA Guidelines and 14 CCR 15358, the terms "effects" and "impacts" are synonymous in this report.

[3] Construction noise that exceeds the ambient level of a sensitive noise receptor is not analyzed because it is considered a temporary impact that would not have an adverse effect on historical resources because it would not cause physical damage and would not permanently alter or diminish the integrity of such resources. Temporary construction noise would not result in a substantial adverse change in the significance of a historical resource and, therefore, would not cause a significant impact under CEQA.

present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time (14 CCR 15355[a]–[b]). The API for cumulative impacts, if any exist, would include the API for direct effects, indirect effects, or both because in order for a cumulative impact to exist, a historical resource must first be directly or indirectly affected by the Project.

1.4.1 Area of Potential Impacts for Built Environment Properties

Dudek's delineation of the API considered the proposed Project activities in conjunction with historic era-built resources that are 45 years of age or older (those built in or prior to 1980) that may sustain impacts due to the construction or operation of the Project.[4] The horizontal limits of the API incorporate areas of direct physical effect that encompass two historic-age properties within the Project site, 534 East Edna Place (APN 8429-008-028) (Map ID 1a) and 522 East Edna Place (APN 8429-008-029) (Map ID 1b), as well as an adjacent historic-age property, the SCE Cortez Substation at 578 East Edna Place (APN 8429-008-800) (Map ID 2). The other three parcels included in the Project site, APN 8429-007-007 (Map ID 3), APN 8429-007-006 (Map ID 4), and APN 8429-007-005 (Map ID 5), were not included in in the API because they do not contain any built environment resources. Because of the geographically constrained nature of the Project activities, the API is horizontally confined to the delineation presented in Figure 2, Built Environment Area of Potential Impacts. The buildings and structures evaluated in the API are also included in Table 1.

Energy would be transported between the Project substation at 534 East Edna Place (APN 8429-008-028) and the adjacent SCE Cortez Substation through a proposed gen-tie line. The 66 kilovolt (kV) gen-tie line would be installed aboveground, pending detailed engineering design. The vertical aboveground extent of the API is anticipated to be the approximately 75-foot height of the gen-tie line. At this height, it would be consistent with the existing equipment at the SCE Cortez Substation and the existing transmission lines along East Edna Place. Therefore, the proposed Project would not cause any adverse visual effects to the setting characteristics of any historic built resources within the API.

The vertical underground extent of the API is currently unknown. There will be a collection line between the east and west site, installed below ground on Edna Place or above ground along the southern boundary of the Project sites, with an overhead easement along the properties between the two sites. The vertical underground extent would consist of the ground disturbance associated with the trenching for the line. It would be located within a duct bank, which is an underground reinforced concrete container used for laying utility lines such as electric and telecommunication cables. Overall, the vertical underground extent of the API would be limited to the depth required for the duct bank.

The API excludes the historic-age properties directly across from the Project site on the north side of East Edna Place (545 East Edna Place, built 1957, and 522 East Edna Place, built 1960), the adjacent properties to the east (576 East Edna Place, built 1961) and west (636 North Barranca Avenue, built 1961), and the former Southern Pacific Railroad (built circa [c.] 1897) directly south of the Project site (ParcelQuest 2025; Nationwide

[4] While the 50-year threshold is generally used for listing resources in the NRHP and the CRHR, the California Office of Historic Preservation's (OHP) Instructions for Recording Historical Resources recommends recording "any physical evidence of human activities over 45 years . . . for the purposes of inclusion in the OHP's filing system." It also allows for the "documentation of resources less than 45 years . . . if those resources have been formally evaluated, regardless of the outcome of the evaluation." Further, the guidance notes that the 45-year threshold recognizes that there is commonly a 5-year lag between resource identification and the date that planning decisions are made, and thus it explicitly encourages the collection of data about resources that may become eligible for the NRHP or CRHR within that planning period. More restrictive criteria must be met before the resources included in OHP's filing system are listed, found eligible for listing, or otherwise determined to be important in connection with federal, state, and local legal statuses and registration programs (OHP 1995:2).

Environmental Title Research, LLC [NETR] 2025a). These properties would not be directly affected by the proposed Project construction activity, which would remain within the right-of-way of East Edna Place and would not transect these properties.

Finally, since there are no reasonably foreseeable Project activities that would occur later in time or that would be farther removed in distance that could indirectly affect historical resources, the API contains no geographic areas under consideration for indirect effects.

Table 1. Resources Located within the API for Built Resources

Map ID	Name/Use	APN	Address	Year Built	Evaluation Status
Inside the Project Site					
1a	Industrial building	8429-008-028	534 E. Edna Place	1959	Previously unevaluated
1b	Industrial building	8429-008-029	522 E. Edna Place	1960	Previously unevaluated
2	SCE Cortez Substation	8429-008-800	578 E. Edna Place	c. 1964	Previously unevaluated

Note: APN = Assessor Parcel Number; E. = East; SCE = Southern California Edison; c. = circa.

Built Environment Area of Potential Impacts

Covina Reliability Project

INTENTIONALLY LEFT BLANK

2 Literature Review, Background Research, and Methods

This section provides the results of the CHRIS records search from the South Central Coastal Information Center (SCCIC) and a summary of archival research methods and additional records reviewed. This information was used to prepare the historic context and the significance evaluations.

2.1 California Historical Resources Information System Records Search

On February 17, 2025, Dudek conducted a search of the CHRIS at the SCCIC, located on the campus of California State University, Fullerton. The search included any previously recorded cultural resources and investigations within a 1-mile radius of the Project site. The CHRIS search also included a review of the NRHP, the CRHR, California Points of Historical Interest, California Historical Landmarks, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. Dudek reviewed the SCCIC records to determine whether implementation of the proposed Project would have the potential to impact any known and unknown cultural resources. The results presented below only discuss previously conducted cultural resource studies that include historic built environment resources and previously recorded historic built environment resources.

2.1.1 Previously Conducted Cultural Resource Studies

Results of the cultural resources records search indicate that three previous cultural resource studies were conducted within 1 mile of the Project site between 2011 and 2017. None of the three previous cultural resource studies containing built environment resources overlap or are immediately adjacent to the Project site, indicating that the entirety (100%) of the Project site has not been subject to any previous built environment investigations. Table 2, below, includes the three cultural resource studies that appear to include built environment resources. These studies primarily consist of cultural resource records searches. However, copies of the reports were not provided by the SCCIC. For the full results of the records search including archaeological resource studies, see Dudek's Cultural Resources Inventory and Evaluation Report Covina Reliability Project (Dudek 2025).

Table 2. Previous Cultural Resources Studies Within 1 Mile of the API

IC Report ID	Author	Year	Report Title
Outside Project Site			
LA-11223	Shannon L. Loftus	2011	Cultural Resource Records Search and Site Survey - Clear Wireless, LLC Site CA-LOS0119A Covina Center for the Performing Arts, 104 North Citrus Avenue, Covina, Los Angeles County, California 91723
LA-13246	Natalie Loukianoff and Stevan Treffers	2015	Historical Resource/Historic Property Analysis of the Covina Substation, City of Covina, Los Angeles County, California
LA-13246A	Audry Williams	2017	Addendum To: Historical Resource/Historic Property Analysis of the Covina Substation, City of Covina, Los Angeles County, California

2.1.2 Previously Recorded Built Environment Resources

The SCCIC records search indicated that there are no previously recorded built environment resources in the API. Two previously recorded built environment resources were identified within 1 mile of the API. The Covina Center for the Performing Arts (P-19-189466) at 104 North Citrus Avenue was determined ineligible for the NRHP and is located approximately 1 mile southwest of the Project site. The Covina Substation (P-19-192461) at East San Bernardino Road and Second Avenue did not have a listed status code and is located approximately 0.6 miles southwest of the Project site. All previously recorded built environment resources located within a 1-mile radius of the API are summarized in Table 3 below.

Table 3. Previously Recorded Built Environment Resources Within 1 Mile of the API

Primary Number	Description	Recording Events	CRHR Status
Outside Project Site			
P-19-189466	The Covina Center for the Performing Arts 104 N. Citrus Avenue	2011 (Loftus)	6Y
P-19-192461	Covina Substation E. San Bernardino Road and Second Avenue	2015 (Loukianoff)	Not listed

Notes: CRHR = California Register of Historical Resources; CHL = California Historical Landmark; N. = North; E. = East.
California Historical Resource Status Codes
6Y = Determined ineligible for NRHP by consensus through Section 106 process – Not evaluated for CRHR or local listing.

2.2 Additional Records Reviewed

The following sources provide additional information regarding the potential of built environment resources located within the API. This information was used to understand the history of the area and how the landscape has changed and developed over time.

2.2.1 Built Environment Resource Directory

The California Office of Historic Preservation maintains and processes the Built Environment Resource Directory, an inventory of built environment cultural resources. On February 26, 2025, Dudek searched for the subject properties in the Built Environment Resource Directory. None of the properties were included in the directory, indicating they have not been previously identified or evaluated.

2.2.2 Calisphere

Calisphere provides access to 2,000 collections contributed by more than 300 cultural heritage organizations in California, including universities, libraries, archives, museums, and historical societies. Dudek searched for the subject properties' addresses and other keywords on Calisphere on February 26, 2025. This search did not identify any materials pertaining to the subject properties.

2.2.3 Online Archive of California

The Online Archive of California provides free public access to detailed descriptions of primary resource collections maintained by more than 300 contributing institutions including libraries, special collections, archives, historical societies, and museums throughout California and collections maintained by the 10 University of California campuses. Dudek searched for historical tenants and addresses associated with the subject property on Online Archive of California on February 26, 2025, and did not identify any relevant materials.

2.2.4 City of Covina Building Permits

Dudek submitted a public records request for building permits associated with the Project on February 27, 2025 (Reference No: 25-072). The City responded to the public records request on March 4, 2025, and sent Dudek a link to digital building permits for 534 East Edna Place and 522 East Edna Place. However, there were no building permits on file for 578 East Edna Place. Dudek reviewed all available permits consisting of building, electrical, and plumbing permits. Property ownership information from these documents was used in Section 4.2, Descriptions and Evaluations of Resources in the API, of this report.

2.2.5 Covina Town Center Historic Resources Survey

As part of the background research for this study, Dudek reviewed the Covina Town Center Historic Resources Survey from 2007. Historic Preservation Partners completed a citywide survey and developed an inventory of sites and groupings recommended for inclusion in the City of Covina Historic Resources Inventory. The subject properties are not included in the report's recommended inventory (HPP 2007).

2.2.6 Historic Aerials and Maps

A review of historic aerial photographs was conducted as part of the archival research effort for the proposed Project. The aerial photographs provided a general idea of growth in the neighborhoods and on the subject properties (NETR 2025a). U.S. Geological Survey topographic maps were examined to determine the growth in the area and how the properties developed over time (NETR 2025b).

2.2.7 Historical Newspapers

Dudek reviewed historical newspapers from the California Digital Newspaper Collection and Newspapers.com covering Covina and the surrounding area to understand the development of the city and the subject properties. These documents were used in the preparation of Chapter 3, Historic Context, and Chapter 4, Results of Identification and Evaluation Efforts.

2.2.8 ParcelQuest

Dudek obtained assessor data from ParcelQuest for the subject properties on February 26, 2025. These data provided information about the properties' construction date, square footage, and current owners.

2.3 Interested Party Correspondence

On March 3, 2025, Dudek Architectural Historian Katie Ahmanson, MHC, sent an outreach letter and figure depicting the Project site to the Covina Valley Historical Society, Covina Library, and Covina Community Development Department. The letter provided a brief description of the proposed Project and requested information about historic and cultural components in or near the Project site. To date, no responses have been received. Copies of the interested party correspondence have been submitted in conjunction with this Project and all responses are in Appendix A.

2.4 Field Survey

Dudek Architectural Historian Katie Ahmanson, MHC, conducted an intensive survey of the API on March 14, 2025. The survey entailed documenting the exteriors of each property with notes and photographs; specifically noting character-defining features, spatial relationships, and observed alterations; and examining any historic landscape features on the properties.

3 Historic Context

This context is provided to ascertain what significant themes and building types are present. Dudek provides this information to better understand the context of any of the newly documented resources in the API.

3.1 Historical Overview of the City of Covina

Covina was established in 1885 in the San Gabriel Valley about 22 miles east of Los Angeles (City of Covina 2023a). Initially, the area was inhabited by the Tongva band of Native Americans, who dominated the area until the arrival of the Spanish. During the Spanish period in the 1770s, the area was part of Rancho La Puente, which supported the San Gabriel Mission. Members of the local tribes were gathered from the surrounding area and required to build the mission structure and worked on the ranch to cultivate crops (LA County Library 2023).

In 1822, the political situation changed as Mexico won its independence from Spain, and the San Gabriel Valley region became part of the Mexican Republic. Rancho La Puente was passed into private ownership for several years until the land was granted to John Rowland in 1842 (LA County Library 2023). Rowland purchased the land from the Mexican government with his partner William Workman and expanded the rancho from 17,740 acres to 48,790 acres by 1845. However, after Rowland's death in 1873, his wife sold 5,500 acres of the ranch to Julian and Antonia Badillo. The Badillos made a failed attempt to grow coffee on the land and sold their land to the Hollenbecks, who sold about 2,000 acres of the ranch to Joseph Swift Philips in 1883 (Town Square Publications 2023). Philips planted wheat and barley on the land but soon subdivided the land for the development of the Town of Covina. In January 1885, the Phillips tract officially opened for sale and the first issue of the Covina Independent was published (Broadwell 2022).

The fertile soil in the area lent itself to a successful agricultural industry that encouraged settlers to move to Covina. Additionally, the Southern Pacific Railroad and Pacific Electric Streetcar developed railroads through the city, aiding in the growth of the population and the transportation of the local produce. By 1901, the city was incorporated and had become the largest shipper of citrus in Los Angeles County at the time. The citrus industry continued to dominate Covina's economy throughout the early twentieth century until the end of World War II (City of Covina 2023b:1).

As the nation entered World War II, the area's sparsely populated agricultural landscape rapidly transformed into a residential center. Covina continued to develop during the post-war years, as a population boom in the Los Angeles area turned the region into a megalopolis. Automobile-oriented development increased access to the once rural area, and the development of the San Bernardino Freeway in 1954 further bolstered Covina's growth (City of Covina 2023b:1). The population of Covina increased over 400% between 1950 and 1960, and historic aerial photographs from the period show that suburbanization overtook the remaining agricultural areas (City of Covina 2023b:1; NETR 2025a). Although Covina was focused on residential growth throughout the 1950s, the city saw more institutional and commercial growth during the 1960s. Historic aerial photographs show the construction of the Project site, as well as the industrial properties directly north, east, and south of the Project site, occurring between 1954 and 1964. Further industrial development in the surrounding area is visible in aerial photographs between 1964 and 1977 (NETR 2025a). Examples of nearby industrial buildings constructed in this period include 545 East Edna Place (1957), 515 East Edna Place (1961), and 565 East Edna Place (1963) on the north side of Edna Place across from the Project site, as well as 576 East Edna Place (1961) directly east of the Project site (ParcelQuest 2025).

The 1970s were a period of slower growth and development than the previous decades since much of Covina's infrastructure had been established during the 1950s and 1960s (Covina Past 2015). Throughout the late 1970s to the 1990s, Covina's economy was dominated by commercial industries. By 1997, Covina contained about 46,500 residents and reached a span of 10 square miles, including unincorporated territory designed to eventually be annexed by Covina (City of Covina 2023b:1). Today, Covina is primarily composed of residential properties and continues to thrive in its commercial industries. The current population stands at about 47,914 residents (World Population Review 2025).

3.2 Southern California Edison Company

3.2.1 Company History

SCE is a subsidiary company of Edison International and is the largest electrical supply company in Southern California. Edison International was formed by the merger and acquisition of smaller electrical companies in 1886. At the time, Thomas Edison only allowed electrical utilities to use his patent if his name was used in the title of the company (EI 2023; SCE 2023).

As the population of Los Angeles steadily increased during the late 1890s, the need for power grew. Several businessmen in Los Angeles formed the Westside Lighting Company, later known as the SCE, as a subsidiary of Edison International to address residents' needs. By 1897, Los Angeles adopted an undergrounding ordinance to reduce the overhead clutter of power infrastructure. To create underground lines throughout Los Angeles, Westside Lighting used Thomas Edison's patented three-wire conduit technology. However, because of the use of Edison's patent, the company was required to change its name; they chose the Edison Electric Company. By 1907, Edison Electric completed construction of the Kern River Hydro Powerhouse and began producing power to the Los Angeles Basin with a 75 kV transmission line, the highest voltage in the nation at the time. Additionally, it was the first line to be built on steel towers. In 1909, Edison Electric merged with several smaller electrical companies throughout the Southern California region to form SCE (EI 2023; SCE 2023).

In 1912, the Los Angeles Water Department began extending its operations to include hydroelectric generation and local electricity distribution after the Los Angeles City Council voted to begin negotiations to purchase local electrical facilities. Between 1922 and 1937, SCE sold its hydroelectric facilities to the City of Los Angeles. However, its loss of business was offset by the suburban growth of Los Angeles County. With more energy generation needed throughout the area, SCE created a transmission line with the capacity to retain 220 kV by 1922. As a result of their innovative achievement, SCE became the first recipient of the Charles A. Coffin Medal, known as the Thomas A. Edison award today. In 1926, SCE completed construction of the largest multiple-arch dam in the world at the time, the Florence Lake Dam. The groundbreaking design reduced the amount of concrete needed to be carried up the mountains. By 1929, construction began on the SCE's headquarters in downtown Los Angeles, and it was completed in 1931. In 1939, the SCE received its share of power from the Hoover Dam after completing a 220 kV transmission to the dam (EI 2023).

During the outbreak of World War II, Edison International collected scraps of materials from their plants, such as rubber, copper, iron, steel, and brass to donate to the war effort. Additionally, SCE engineers helped design the electrical system for a plutonium extraction facility to develop nuclear weapons for the war. Because of their efforts, SCE was awarded the Charles A. Coffin Medal and the National Security Award. By 1946, the country established a standard for electricity that required a current alternating at 60 cycles per second. To accommodate the new

standard, SCE changes its 50-cycle system to a 60-cycle system, requiring a massive rewiring program taking nearly 3 years to complete. In addition, the company completed construction of 10 gas- and oil-fired steel plants between 1945 and 1970 (EI 2023).

By 1957, SCE completed construction of the 7.5-megawatt nuclear power plant, the Santa Susana Experimental Nuclear Station, in the Santa Susanna Mountains. The company became the first investor in the country to generate electricity commercially from a nuclear reactor. During the 1960s, SCE continued to expand their facilities. In 1962, purchased the electric, gas, and water systems on Catalina Island and installed modern facilities, as well as a seawater desalination plant to support the production of freshwater on the island. The company further expanded in 1964 when they acquired the California Electric Power Company. By 1968, SCE completed construction of the 450-megawatt San Onofre Nuclear Generation Station Unit 1, and between 1967 and 1970, they built the Pacific AC-DC Intertie, the first major high-voltage direct current line in the country capable of transporting 8,000 megawatts of power. In 1972, Units 2 and 3 of the San Onofre Nuclear Generation Stations were completed (EI 2023).

The rising cost of fossil fuel during the 1970s led to SCE's interest in producing renewable energy technologies to generate alternative power. Throughout the 1970s and 1980s, the SCE research, development, and demonstration department researched cutting-edge power development. By 1978, they established the Wind Energy Research Center in Palm Springs and constructed a 10-megawatt geothermal power plant in Brawley. In 1980, SCE Chief Executive Officer William R. Gould announced the company's initiative to develop 2,000 megawatts of alternative and renewable energy. Along with the U.S. Department of Energy and the Los Angeles Department of Water and Power, SCE developed a solar thermal plant in the Mojave Desert during the 1980s that began operating by 1996 (EI 2023).

The California energy crisis of the early 2000s saw the price of independent power rise. As a result, SCE purchased abandoned plants through Southern California to relieve power shortages. To alleviate power costs, SCE began construction of the first transmission line to only carry renewable power with the Tehachapi Renewable Transmission Line in 2007. Likewise, in 2008, SCE launched their solar photovoltaic rooftop program to promote the addition of solar panels to buildings. Today SCE owns over 104,000 miles of circuits across its service territory. SCE maintains its infrastructure with individually constructed substations that distribute electricity throughout the area through transmission lines. The SCE service territory includes portions of Fresno, Inyo, Kern, Kings, Los Angeles, Madera, Mono, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, Tulare, and Ventura Counties. As of 2023, SCE continues to promote the production of renewable energy and serves over 15 million people throughout Southern California with over 700 substations (EI 2023; SCE 2023).

3.2.2 Substations and Southern California Edison Substations

Substations disseminate electricity that is transmitted from a generating facility. The primary function of a substation is the conversion of electrical currents between voltages and circuits. As transmission lines carry electrical circuits to the substation, switchgears carry the current to transformers that convert the current to the desired voltage (Pacific Gas & Electric 2020:4.21). Substation design includes structures such as the intake from high-voltage transmission lines, transformers, switchgear, shield wires, and lightning arrestors that divert lightning to the ground through towers (Kramer 2012:49). There are three types of substations: step-up transmission substations, step-down transmission substations, and distribution substations. As described in SCE's Historic-Era Electrical Infrastructure Management Program (Tinsley Becker et al. 2017:65):

The step-up type receives power from a nearby generating facility and uses a large power transformer to increase the voltage for transmission to distant locations. The stepdown type serves as switching points wherein the transmitted voltage may be reduced to a sub transmission level and further transmitted to customers via the electrical grid. The distribution substation type is the end-user facility that connects to local customers at varying low-voltage levels. Substations are designed to fulfill all or some of the following functions:

- Change voltage from one level to another,
- Regulate voltage to compensate for system voltage changes,
- Switch transmission and distribution circuits into and out of the grid system,
- Measure electric power qualities flowing in the circuits,
- Connect communication signals to the circuits,
- Eliminate lightning and other electrical surges from the system,
- Connect electric generation plants to the system,
- Make interconnections between the electric systems of more than one utility, and
- Control reactive kilovolt-amperes supplied to and the flow of reactive kilovolt amperes in the circuits.

Early SCE substations in Southern California, constructed between c. 1909 and the 1930s, were often designed in architectural styles associated with the time such as the Classical Revival, Mission Revival, and Spanish Revival. In some cases, substations were designed to resemble a single-family residence within neighborhoods to complement their surroundings. These substations were primarily constructed as stand-alone structures containing engineering equipment. Substations were expanded based on consumer demand and typically consisted of the addition of transformers and switches (Tinsley Becker and Chiang 2015:13).

By the 1940s, shortages of material due to World War II resulted in substations constructed with no particular style or decoration. As a result, SCE promoted more utilitarian style substations that could be efficiently built and stopped constructing Monumental buildings to disguise the power infrastructure. Structures built to contain equipment were void of stylistic details and typically constructed of corrugated aluminum or transite siding. Before 1950, SCE had installed approximately 150 substations. In 1950, SCE acquired or developed approximately 401 additional substations, and the company's portfolio continued to steadily increase in subsequent decades. At the time the SCE Cortez Substation was constructed, c. 1964, the company often used standardized, utilitarian components (Tinsley Becker and Chiang 2015:13).

In 2015, the SCE developed a typology for its historic-era substations categorized by the types of buildings they resemble defined six types of substations: Monumental, Commercial, Residential, Civic, Religious, and Astylistic (Tinsley Becker and Chiang 2015:13).

Monumental type substations do not resemble a property type but rather reflect a substantial presence through their scale, massing, and formal appearance. These substations are properties constructed with an emphasis on architectural value and aesthetics. They were typically constructed with reinforced concrete with a height between one and six stories. There are three subtypes of the Monumental type: the Block, Box, and Multi-Part subtypes. The Block subtype consists of buildings that are over three stories with bays of windows and overhangs. The Box subtype consists of rectangular buildings with either a cornice or recessed panels. The Multi-Part subtype is organized in

two to three parts and features the Classical Revival style or classical elements such as pediments and piers (SCEC 1968:7-14).

Commercial types resemble buildings for businesses and were often constructed in Period Revival styles. There are three subtypes, banks, offices, and retail. The Commercial type is primarily used in commercial areas to disguise the appearance of electrical infrastructure substations (Tinsley Becker and Chiang 2015:13).

The Residential type refers to substations designed to look like single-family or multifamily residences. There are three subtypes, Apartments, Bungalows, and Cottages. Residential type substations are typically constructed in residential neighborhoods, designed to blend in with the surrounding architecture substations, and mostly designed in the Spanish Colonial Revival style (Tinsley Becker and Chiang 2015:14).

Civic substations are the most common types of substations and typically reflect Classical Revival style brick buildings. There are four subtypes, three of which resemble libraries and one that resembles post offices (Tinsley Becker and Chiang 2015:13). The library subtypes are divided into three models with Library 1 being the most common (Tinsley Becker et al. 2017:97).

Religious type substations are the least common and often resemble Spanish Colonial Revival style churches. They do not have any subtypes (Tinsley Becker et al. 2017:98).

Lastly, Asytlistic type substations are defined as substations that are not architecturally significant but may be historically significant for other reasons (for example, their association with a historical event or for innovation in engineering). During the 1940s, SCE substations were void of ornamentation or architectural style and this utilitarian approach to substation development continued for the succeeding decades. SCE no longer attempted to disguise its power infrastructure with buildings and instead left structures exposed with smaller buildings to contain equipment (SCE 2023; Tinsley Becker and Chiang 2015:14). There are four subtypes: Steel 1, Steel 2, Brick, and Concrete (Tinsley Becker et al. 2017:99).

INTENTIONALLY LEFT BLANK

4 Results of Identification and Evaluation Efforts

This section provides a physical description and an evaluation of each of the resources identified in the API under NRHP, CRHR, and local listing criteria to assess the historical significance and integrity. California Department of Parks and Recreation 523 Forms are available in Appendix B.

4.1 Survey Results

Three resources over 45 years of age at the time of survey were recorded and evaluated for historical significance. These resources are summarized below in Table 4. Descriptions and evaluations of these resources are presented in Section 4.2 in order by Map ID.

Table 4. Built Environment Properties Recorded and Evaluated in the API

Map ID	Property Type	Address/APN	Year Built
1a	Industrial	534 E. Edna Place (APN 8429-008-028)	1959
1b	Industrial	522 E. Edna Place (APN 8429-008-029)	1960
2	Substation	578 E. Edna Place (APN 8429-008-800)	c. 1964

Notes: APN = Assessor's Identification Number; E. = East; c. = circa.

4.2 Descriptions and Evaluations of Resources in the API

4.2.1 Map ID 1: 534 East Edna Place (APN 8429-008-028)/522 East Edna Place (APN 8429-008-029)

Property History

Due to their shared histories, the industrial buildings are evaluated as a single resource in this report (Map ID 1). The industrial buildings located at 534 East Edna Place (Map ID 1a) and 522 East Edna Place (Map ID 1b) were constructed in 1959 and 1960 respectively (ParcelQuest 2025). Building permit applications on file with the City indicate that Louis J. Frye owned both parcels in 1958 before their development (Permits No. 41410 and No. 44206) (City of Covina 2025). The original building permit for 534 East Edna Place reveals that a 12,960-square-foot one-story building designed by George Thomson was constructed in 1959 (Permit No. 41084) (City of Covina 2025). That same year, both properties were sold to Edwin A. Begin, who built a 60-foot × 72-foot concrete block addition to the existing building (Permit No. 72085) (City of Covina 2025). In 1960, Begin constructed a 5,880-square-foot warehouse and storage building at 522 East Edna Place and added a 10,080-square-foot concrete-block addition 3 months later (Permits No. 00245 and No. 00341) (City of Covina 2025).

After Begin's ownership, 534 East Edna Place changed hands multiple times as identified in the following timeline (City of Covina 2025):

- 1962: Zerunieth MFC (Permit No. 06423)
- 1962: United Engineering Co. (Permit No. 01102)

- 1967: Michigan Landau Tops (Permit No. 18521)
- 1976-1977: Champion Billiard Specialists (PG 1976: 5; LAT 1977:168)
- 1978: James Seedurger (Permit No. 46308)
- 1993: Joe C. Bowling (Permit No. 2788-93)
- 2011: Romona B. Bowling (Permit No. B00-004-202)
- 2023–2025: Bory Brothers LLC (ParcelQuest 2025)

The owners and occupants of 522 East Edna Place changed hands in 1961 when it became Hermes Café (Permit No. 00245) (City of Covina 2025). The next known owner/occupant was Bory Brothers LLC between 2023 and 2025 (ParcelQuest 2025).

Description

Map ID 1a at 534 East Edna Place (APN 8429-008-028) contains an industrial building and associated parking lot constructed in 1959 (ParcelQuest 2025). A concrete driveway leads south from East Edna Place to the asphalt parking lot fronting the primary (west) elevation of the building. The industrial building is rectangular and one story with a flat roof featuring a parapet and painted concrete masonry unit cladding. The primary (west) elevation contains 12 bays each containing a metal roll-up garage door, a metal-sash multi-light double-hung window, and a single-panel metal door covered by a metal awning (Photograph 1). The north elevation features a metal roll-up garage door covered by a metal awning and three metal-sash double-hung windows (Photograph 2). The rear (east) elevation includes single-panel metal doors and metal-sash multi-light double-hung windows covered by metal awnings. Chain-link fencing encases the rear (east) elevation. All fenestration is recessed on the elevations. Only the south elevation was not visible during the survey.

Source: Dudek, IMG_9011.

Photograph 2. The north and rear (east) elevations of 534 East Edna Place, view looking southwest. Photograph taken on March 14, 2025.

Source: Dudek, IMG_9006.

Map ID 1b, 522 East Edna Place (APN 8429-008-029), is an industrial building and associated parking lot constructed in 1960 (ParcelQuest 2025). A concrete driveway leads south from East Edna Place to the asphalt parking lot fronting the primary (east) elevation of the building. The industrial building is rectangular and one story with a flat roof featuring a parapet and painted concrete masonry unit cladding. The primary (east) elevation contains 12 bays each containing a metal roll-up garage door, a metal-sash multi-light double-casement window, and a single-panel door obscured by a metal security screen door covered by a metal awning (Photograph 3). The north elevation features two bays each containing a single-panel fully glazed store-front door with metal-sash fixed windows covered by a projecting stucco clad flat roof (Photograph 4). All fenestration is recessed on the elevations. A concrete masonry unit wall extends along the rear (west) and south elevations west. As such, only the primary (east) and north elevations were visible during the survey. Visible alterations to the building since it was constructed include window and door replacements on the north elevation (dates unknown).

4.2.1.1 Statement of Significance

NRHP and CRHR Evaluation

Archival research did not find any direct associations between Map IDs 1a and 1b and events that have made a significant contribution to the broad patterns of our history. The industrial buildings were constructed in 1959 and 1960 during a period of increased industrial development in Covina. Covina experienced an exponential population increase between 1950 and 1960. This population growth was reflective of statewide trends in the decades following World War II's conclusion in 1945, as well as a shift in the region's predominately agricultural economy to one that included additional industries. Development of the San Bernardino Freeway in 1954 further facilitated accessibility to the region, which allowed for more efficient transportation of goods from Covina to the wider Los Angeles County area. The subject property is generally associated with Covina's industrial development during 1950s and 1960s. However, a mere association with this trend is not sufficient to meet NRHP Criterion A or CRHR Criterion 1. Research also did not identify a significant historical event that occurred on the subject property. Therefore, Map ID 1 is not eligible under NRHP Criterion A or CRHR Criterion 1.

Archival research did not indicate that Map IDs 1a and 1b have a direct association with individuals who made a significant contribution to history at the national, state, or local level. The earliest identified owners of the subject properties were Louis Frye from 1958 to 1959 and Edwin Begin from 1959 to 1960. The buildings were subsequently occupied by short-term owners/occupants until c. 2023 when the current owner, Bory Brothers LLC, purchased the properties (ParcelQuest 2025). Research did not identify additional individuals associated with the identified business and did not uncover information that would indicate that any of the owners/occupants made a significant contribution to history. Due to a lack of identified significant associations with any persons important in our past, Map ID 1 is not eligible under NRHP Criterion B or CRHR Criterion 2.

Both buildings are modest and architecturally undistinguished examples of industrial buildings constructed in 1959 and 1960 with no particular style. They are ubiquitous examples of their type and there are many similar examples in Covina, Los Angeles County, California, and the United States. The buildings are not the work of a notable architect or builder, and archival research failed to reveal substantial information about the contractors of the properties, George Thomas and Edwin Begin. Likewise, the buildings appear to have been constructed through already well-documented and common construction techniques and methods and do not possess high artistic values by articulating a particular concept of design to the extent that they express an aesthetic ideal. The last portion of Criterion C refers to a district, which is defined as a significant and distinguishable entity whose components may lack individual distinction. The subject properties do not contribute to the significance of a potential or existing historic district. Overall, Map IDs 1a and 1b lack sufficient design and construction value to meet NRHP Criterion C or CRHR Criterion 3.

The buildings are not significant as a source, or likely source, of important historical information, nor do they appear likely to yield important information about historic construction methods, materials, or technologies. This technology is well understood through contemporary trade journals and scientific monographs. As such, the subject properties lack significance under NRHP Criterion D or CRHR Criterion 4.

City of Covina Evaluation

As discussed regarding NRHP/CRHR Criterion A/1, research does not indicate that the subject properties were associated with a special element of Covina's cultural, social, economic, political, aesthetic, engineering,

architectural, or natural history. The subject properties are located in a portion of Covina that experienced steady industrial growth through the 1950s and 1960s. They do not appear to be associated with any developmental trends significant to the history of Covina, California, or the United States. Research did not identify the subject properties as being the site of a significant historical event. Therefore, they do not meet eligibility requirements for City of Covina Criterion 1.

As discussed regarding NRHP/CRHR Criterion B/2, research does not indicate that the subject properties were associated with persons or events significant in local, state, or national history. Therefore, they are not eligible under City of Covina Criterion 2.

As discussed regarding NRHP/CRHR Criterion C/3, the subject properties are not representative of the work of a notable builder, designer, or architect. Therefore, they are not eligible under City of Covina Criterion 3.

As discussed regarding NRHP/CRHR Criterion C/3, the subject properties do not embody distinctive characteristics of a style, type, period, or method of construction, nor are they valuable examples of the use of indigenous materials or craftsmanship. The buildings are a ubiquitous typology found throughout Covina, California, and the nation. Therefore, they are not eligible under City of Covina Criterion 4.

The subject properties do not contribute to the significance of a historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties that contribute to each other and are unified aesthetically by plan or physical development. Although the buildings are located within an industrial area of Covina, the subject properties are not a significant example of industrial development from the late 1950s and 1960s. Likewise, they were not constructed as part of a grouping of properties that contribute to each other or are unified aesthetically by plan or physical development. Development of the properties simply followed an already existing pattern of industrial development in the area. The subject properties are utilitarian industrial buildings and do not contribute to a concentration of historic or scenic properties or a thematically related grouping of properties unified by plan or physical development. Furthermore, they do not contribute to the City's two districts: the Downtown Commercial District (designated in 2007) and the Cottage Drive Historic District (designated in 2007) (HPP 2007: Appendix B). Therefore, the subject properties do not meet eligibility requirements for City of Covina Criterion 5.

As discussed regarding NRHP/CRHR Criterion C/3, the subject properties are not one of the few remaining examples in Covina, the region, the state, or the nation possessing distinguishing characteristics of an architectural or historic type or specimen. They do not contain enough distinguishing characteristics of an architectural or historic type or specimen to be considered a significant example of its style or type. The subject properties are a ubiquitous typology and are not some of the few remaining examples in the city, region, state, or nation. Therefore, they are not eligible under City of Covina Criterion 6.

Integrity Assessment

Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. Because the subject properties lack sufficient significance to meet any of the criteria for listing in the NRHP, CRHR, or the City of Covina Historic Resources Inventory, an integrity analysis is immaterial for Map IDs 1a and 1b.

4.2.2 Map ID 2: Southern California Edison Cortez Substation

Description

The subject property at 578 East Edna Place (APN 8429-008-800) contains the SCE Cortez Substation constructed c. 1964 by SCE (NETR 2025a). The SCE Cortez Substation consists of one building and power infrastructure including high voltage transmission towers, lightning arrestors, switchgear, transformers, busbars, and shield wires (Photograph 5). The one-story rectangular building on the southwest corner of the property is clad with painted concrete and has a flat roof with wide overhanging eaves (Photograph 6). A single-panel metal door is located on the west elevation. The property is covered with crushed-stone gravel and is accessed by an asphalt driveway along the western boundary of the property leading south from East Edna Place. Chain-link fencing encases the perimeter of the property. Only partial views of property were visible from the public right-of-way during the survey. Aerial imagery indicates that the substation was altered between 1965 and 1972 by the addition of more electrical infrastructure (NETR 2025a).

4.2.2.1 Statement of Significance

NRHP and CRHR Evaluation

Electrical substations are a necessary component of electrical infrastructure and play an important role in facilitating a city's economic and physical growth. The SCE Cortez Substation was constructed c. 1964 to provide electrical service during a period of increased development in Covina. Although serving an important function, the SCE Cortez Substation is one of many substations developed in the 1950s and 1960s by SCE that represents the expansion of already-existing electrical infrastructure network in the region following World War II. Before 1950, for example, SCE had installed approximately 150 substations. In 1950, they acquired or developed approximately 401 additional substations, and the company's portfolio continued to steadily increase in subsequent decades (Tinsley Becker and Chiang 2015:13). Research also did not identify a significant historical event that occurred at the SCE Cortez Substation. As such, the subject property represents a continuation of a decades-long pattern of SCE's electrical infrastructure expansion in the region that accelerated to accommodate post-World War II residential, commercial, and industrial growth. Therefore, the SCE Cortez Substation is not eligible under NRHP Criterion A or CRHR Criterion 1.

Research did not identify any individuals associated with the SCE Cortez Substation. Since its construction c. 1964, the SCE Cortez Substation has been owned by SCE. Due to a lack of identified significant associations with any persons important in our past, the subject property is not eligible under NRHP Criterion B or CRHR Criterion 2.

The SCE Cortez Substation and associated structures are utilitarian in design and lack the distinctive characteristics of a particular type, period, or method of construction. It is an example of an Astylistic substation, which were constructed post-World War II. Astylistic type substations are defined by the Historic-Era Electrical Infrastructure Management Program document as substations that are not architecturally significant (Tinsley Becker et al. 2017). The Cortez Substation was constructed through already well-documented and common construction techniques and research indicates that it was not technologically or materially innovative within the history of electrical substations. Archival research did not identify an architect, designer, or builder, indicating it is not the work of a master architect or engineer. The last portion of Criterion C refers to a district, which is defined as a significant and distinguishable entity whose components may lack individual distinction. The SCE Cortez Substation does not contribute to the significance of a potential or existing historic district. Overall, the property lacks sufficient design and construction value to meet NRHP Criterion C or CRHR Criterion 3.

The subject property is not significant as a source, or likely source, of important historical information, nor does it appear likely to yield important information about historic construction methods, materials, or technologies. This technology is well understood through contemporary trade journals and scientific monographs. As such, the subject property lacks significance under NRHP Criterion D or CRHR Criterion 4.

City of Covina Evaluation

As discussed regarding NRHP/CRHR Criterion A/1, research does not indicate that the subject property was associated with a special element of Covina's cultural, social, economic, political, aesthetic, engineering, architectural, or natural history. The subject property is located in a portion of Covina that experienced steady industrial growth through the 1950s and 1960s. The subject property is not associated with any developmental trends significant to the history of Covina, California, or the United States. Research did not identify the subject property as being the site of a significant historical event. Therefore, it does not appear eligible under City of Covina Criterion 1.

As discussed regarding NRHP/CRHR Criterion B/2, research does not indicate that the subject property was associated with persons or events significant in local, state, or national history. Therefore, it is not eligible under City of Covina Criterion 2.

As discussed regarding NRHP/CRHR Criterion C/3, the subject property does not appear to be representative of the work of a notable builder, designer, or architect. The original building permits for the buildings were not on file with the City and additional research did not identify an architect or builder for the property. Therefore, it is not eligible under City of Covina Criterion 3.

As discussed regarding NRHP/CRHR Criterion C/3, the subject property does not embody distinctive characteristics of a style, type, period, or method of construction, nor is it a valuable example of the use of indigenous materials or craftsmanship. The building is a common example of an Astylistic substation, which is not considered architecturally significant. The subject property is a ubiquitous typology found throughout Covina, California, and the nation. Therefore, it is not eligible under City of Covina Criterion 4.

The property does not contribute to the significance of a historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties that contribute to each other and are unified aesthetically by plan or physical development. The subject property is an SCE substation and, as such, it is neither a concentration of historic or scenic properties nor a thematically related

grouping of properties unified by plan or physical development. It does not contribute to the City's two districts: the Downtown Commercial District (designated in 2007) and the Cottage Drive Historic District (designated in 2007) (HPP 2007:Appendix B). The subject property does not appear to be part of a grouping of properties that contribute to each other and are unified aesthetically by plan or physical development. Therefore, it is not eligible under City of Covina Criterion 5.

As discussed regarding NRHP/CRHR Criterion C/3, the subject property is not one of the few remaining examples in Covina, the region, the state, or the nation possessing distinguishing characteristics of an architectural or historic type or specimen. It does not contain enough distinguishing characteristics of an architectural or historic type or specimen to be considered a significant example of its style or type. Furthermore, as an Astylistic substation it is not considered architecturally significant. The subject property is a ubiquitous typology and is not one of the few remaining examples in the city, region, state, or nation. Therefore, it is not eligible under City of Covina Criterion 6.

Integrity Assessment

Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. Because the subject property lacks sufficient significance to meet any of the criteria for listing in the NRHP, CRHR, or the City of Covina Historic Resources Inventory, analysis was is immaterial for the subject properties.

5 Findings and Conclusions

The subject properties were evaluated in consideration of NRHP, CRHR, and City of Covina criteria and integrity requirements. As a result of the evaluation, Map ID 1a (534 East Edna Place), Map ID 1b (522 East Edna Place), and Map ID 2 (SCE Cortez Substation) are not recommended eligible for inclusion in the NRHP, CRHR, or the City of Covina Historic Resources Inventory.

No historical resources or historic properties were identified within the Project API as a result of archival research, an SCCIC records search, a field survey, and significance evaluations. The subject properties are not currently listed in any national, state, or local registers, nor have they been previously identified in any local historic resource surveys.

Dudek evaluated the resources in the API in accordance with Section 15064.5(a)(2)–(3) of the CEQA Guidelines using the criteria outlined in Section 5024.1 of the PRC and found that none of the resources within the API are considered historical resources for the purposes of CEQA. The recommended Status Code for Map IDs 1a, 1b, and 2 is 6Z. A summary of the findings is provided below in Table 5.

Table 5. Summary of Significance Evaluations and Findings

Map ID	Address/APN	Year Built	NRHP/CRHR/ City of Covina Eligibility	Assigned California Historical Resource Status code
1a	534 E. Edna Place (APN 8429-008-028)	1959	Not eligible	6Z
1b	522 E. Edna Place (APN 8429-008-029)	1960	Not eligible	6Z
2	578 E. Edna Place (APN 8429-008-800)	c. 1964	Not eligible	6Z

Notes: APN = Assessor Parcel Number; NRHP = National Register of Historic Places; CRHR = California Register of Historical Resources; E. = East; c. = circa.

California Historical Resource Status Codes

6Z = Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

To Whom it May Concern,

I am reaching out today on behalf of Dudek and Covina Reliability Project, LLC to provide you with some information about the Covina Reliability Project. As part of the cultural resources study for the proposed project, Dudek is consulting all regional historical organizations to determine if there are any known historic or cultural resources that may be within the proposed project area. Please see the attached letter and map for more information about the nature and location of the project, and please feel free to contact me should you have questions or information regarding cultural or historical resources in this area.

Thank you,

Katie Ahmanson

Subject: Covina Reliability Project, Covina, Los Angeles County, California

To Whom it May Concern:

Dudek has been retained by Covina Reliability Project, LLC to complete a cultural resources study for the Covina Reliability Project (Proposed Project). The Proposed Project is located at 522 E. Edna Place (Assessor Parcel Number [APN] 8429-008-029), 534 E. Edna Place (APN 8429-008-028), and the Southern California Edison (SCE) Cortez Substation at 578 E. Edna Place (APN 8429-008-800) in Covina, California (see Figure 1 enclosed).

The Proposed Project is to demolish the buildings at 522 E. Edna Place (APN 8429-008-029) and 534 E. Edna Place (APN 8429-008-028) for the construction of a substation. The specific size and equipment for the substation would be finalized as the detailed engineering stages for the Proposed Project progresses. The energy would be transported to and from the Proposed Project substation to the adjacent SCE Cortez Substation through a proposed gen-tie line.

As part of our study, we are consulting all regional historical organizations to determine if there are any known cultural resources that may be affected by the Proposed Project. Your efforts in this process will provide invaluable information for the proper identification and treatment of such resources. If you have any information regarding known cultural resources in the Proposed Project area, please contact me via phone or email (listed below). All comments, emails, or letters received will be included in the reports generated by this study. Thank you for your time regarding our request.

Sincerely,

Katie Ahmanson

534 E. Edna Place does not meet the criteria for the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR) or the City of Covina Historic Resources Inventory. The property was evaluated in accordance with Section 15064.5 (a)(2)-(3) of the CEQA Guidelines using the criteria outlined in Section 5024.1 of the California Public Resources Code. The property is not considered a historical resource under CEQA. As such, this evaluation assigns a 6Z California Historical Resources Status Code to 534 E. Edna Place. See Continuation Sheet.

***P3a. Description**

The north elevation features a metal roll-up garage door covered by a metal awning and three metal-sash double-hung windows (Photograph 3). The rear (east) elevation includes single-panel metal doors and a metal-sash multi-light double-hung windows covered by metal awnings. Chain-link fence encases the rear (east) elevation. All fenestration is recessed on the elevations. Only the south elevation was not visible during the survey.

***B10. Significance**

The following historic context is adapted from the *Built Environment Inventory and Evaluation Report for the Covina Reliability Project* prepared in March 2025 by Dudek.

Historical Overview of the City of Covina

Covina was established in 1885 in the San Gabriel Valley about 22 miles east of Los Angeles (City of Covina 2023a). During the Spanish period in the 1770s, the area was part of Rancho La Puente that supported the San Gabriel Mission (Homestead Museum 2023). In 1822, the political situation changed as Mexico won its independence from Spain, and the San Gabriel Valley region became part of the Mexican Republic. Rancho La Puente was passed into private ownership for several years until the land was granted to John Rowland in 1842 (Homestead Museum 2023). After Rowland's death in 1873, his wife sold 5,500-acres of the ranch to Julian and Antonia Badillo. The Badillo's sold their land to the Hollenbecks, who sold about 2,000-acres of the ranch to Joseph Swift Philips in 1883 (Town Square Publications 2023). Philips subdivided the land for the development of the town of Covina. In January 1885, the Phillips tract officially opened for sale and the first issue of the *Covina Independent* was published (Broadwell 2022).

The fertile soil in the area lent itself to a successful agricultural industry that encouraged settlers to move to Covina. Additionally, the Southern Pacific Railroad and Pacific Electric Streetcar developed railroads through the city, aiding in the growth of the population and the transportation of the local produce. By 1901, the city was incorporated and had become the largest shipper of citrus in Los Angeles County at the time. The citrus industry continued to dominate the city's economy throughout the early twentieth century until the end of World War II (City of Covina 2023b: 1).

As the nation entered World War II, the area's sparsely populated agricultural landscape rapidly transformed into a residential center that continued to develop during the post-war years (City of Covina 2023b: 1). The population of Covina increased over 400% between 1950 and 1960, and historic aerial photographs from the period show that suburbanization overtook the remaining agricultural areas (City of Covina 2023b: 1; NETR 2025). Although the city was focused on residential growth throughout the 1950s, the city saw more institutional and commercial growth during the 1960s. Historic aerial photographs show the construction of the Project site, as well as the industrial properties directly north, east, and south of the Project site, between 1954 and 1964. Further industrial development in the surrounding area is visible in aerial photographs between 1964 and 1977 (NETR 2025). Examples of nearby industrial buildings constructed in this period include 545 E Edna Place (1957), 515 E. Edna Place (1961), and 565 E. Edna Place (1963) on the north side of Edna Place across from the Project site, as well as 576 E. Edna Place (1961) directly east of the Project site (ParcelQuest 2025).

The 1970s were a period of slower growth and development than the previous decades since much of the city's infrastructure had been established during the 1950s and 1960s (Covina Past 2015). Throughout the late 1970s to the 1990s, Covina's economy was dominated by commercial industries (City of Covina 2023b: 1). Today, the City of Covina is primarily composed of residential properties and continues to thrive in its commercial industries. The current population stands at about 47,914 residents (World Population Review 2025).

NRHP/CRHR Evaluation

Archival research did not find any direct associations between 534 E. Edna Place and events that have made a significant contribution to the broad patterns of our history. The industrial building was constructed in 1959 during a period of increased industrial development in Covina. The city experienced an exponential population increase between 1950 and 1960. This population growth was reflective of both state-wide trends in the decades following World War II's conclusion in 1945, as well as a shift in the region's predominately agricultural economy to one that included additional industries. Development of the San Bernardino Freeway in 1954 further facilitated accessibility to the region that allowed for more efficient transportation of goods from Covina to the wider Los Angeles County area. The subject property is generally associated with Covina's industrial development during 1950s and 1960s. However, a mere association with this trend is not sufficient to meet NRHP Criterion A or CRHR Criterion 1. Research also did not identify a significant historical event that occurred on the subject property. Therefore, 534 E. Edna Place is not eligible under NRHP Criterion A or CRHR Criterion 1.

Archival research did not indicate that 534 E. Edna Place has a direct association with individuals who made a significant contribution to history at the national, state, or local level. The earliest identified owner of the subject property was Louis Frye from 1958 to 1959, and Edwin Begin from 1959 to 1960. The building was subsequently occupied by short-term owners/occupants until c. 2023 when the current owner, Bory Brothers LLC, purchased the property (ParcelQuest 2025). Research did not identify additional individuals associated with the identified business and did not uncover information that would indicate that any of the owners/occupants made a significant contribution to history. Due to a lack of identified significant associations with any persons important in our past, 534 E. Edna Place is not eligible under NRHP Criterion B or CRHR Criterion 2.

The building is a modest and architecturally undistinguished example of an industrial building constructed in 1959 with no particular style. It is a ubiquitous example of the type and there are many similar examples in Covina, Los Angeles County, California, and the United States. The building is not the work of a notable architect or builder, and archival research failed to reveal substantial information about the contractor of the property, George Thomas. Likewise, the building appears to have been constructed through already well-documented and common construction techniques and methods and does not possess high artistic values by articulating a particular concept of design to the extent that they express an aesthetic ideal. The last portion of Criterion C refers to a district, which is defined as a significant and distinguishable entity whose components may lack individual distinction. The subject property does not contribute to the significance of a potential or existing historic district. Overall, 534 E. Edna Place lacks sufficient design and construction value to meet NRHP Criterion C or CRHR Criterion 3.

The building is not significant as a source, or likely source, of important historical information, nor does it appear likely to yield important information about historic construction methods, materials, or technologies. This technology is well understood through contemporary trade journals and scientific monographs. As such, the subject property lacks significance under NRHP Criterion D or CRHR Criterion 4.

City of Covina Evaluation

As discussed in NRHP/CRHR Criteria A/1 research does not indicate that the subject property was associated with a special element of the city's cultural, social, economic, political, aesthetic, engineering, architectural or natural history. The subject property is located in a portion of Covina that experienced steady industrial growth through the 1950s and 1960s. It does not appear to be associated with any developmental trends significant to the history of Covina, California, or the United States. Research did not identify the subject property as being the site of a significant historical event. Therefore, it does not meet eligibility requirements for City of Covina Criterion 1.

As discussed in NRHP/CRHR B/2, research does not indicate that the subject property was associated with persons or events significant in local, state, or national history. Therefore, it is not eligible under City of Covina Criterion 2.

As discussed in NRHP/CRHR Criterion C/3, the subject property is not representative of the work of a notable builder, designer, or architect. Therefore, it is not eligible under City of Covina Criterion 3.

As discussed in NRHP/CRHR Criterion C/3, the subject property does not embody distinctive characteristics of a style, type, period, or method of construction, or are valuable examples of the use of indigenous materials or craftsmanship. The building is a ubiquitous typology found throughout Covina, California, and the nation. Therefore, it is not eligible under City of Covina Criterion 4.

The subject property does not contribute to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development. Although the building is located within an industrial area of the city, the subject property is not a significant example of industrial development from the late 1950s. Likewise, it was not constructed as part of a grouping of properties that contribute to each other or are unified aesthetically by plan or physical development. Development of the property simply followed an already existing pattern of industrial development in the area. The subject property is a utilitarian industrial building and does not contribute to a concentration of historic or scenic properties, nor a thematically related grouping of properties unified by plan or physical development. Furthermore, it does not contribute to the City's two districts: the Downtown Commercial District (designated in 2007) and the Cottage Drive Historic District (designated in 2007) (HPP 2007: Appendix B). Therefore, the subject property does not meet eligibility requirements for City of Covina Criterion 5.

As discussed in NRHP/CRHR Criterion C/3, the subject property is not one of the few remaining examples in the city of Covina, region, state, or nation possessing distinguishing characteristics of an architectural or historic type or specimen. It does not contain enough distinguishing characteristics of an architectural or historic type or specimen to be considered a significant example of its style or type. The subject property is a ubiquitous typology and is not one of the few remaining examples in the city, region, state, or nation. Therefore, it is not eligible under City of Covina Criterion 6.

Integrity Considerations

Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. Because the subject property lacks sufficient significance to meet any of the criteria for listing in the NRHP, CRHR, or the City of Covina Historic Resources Inventory, an integrity analysis is immaterial for 534 E. Edna Place.

Summary of Evaluation Findings

Dudek concludes that the subject property is not eligible for listing in the NRHP CRHR, or the City of Covina Historic Resources Inventory due to a lack of significant associations and architectural merit. The recommended California Historical Resource Status Code for the property is 6Z, meaning it was found ineligible for the NRHP, CRHR, or the City of Covina Historic Resources Inventory through survey evaluation.

***P3a. Description**

The north elevation features two bays each containing a single-panel fully glazed store-front doors with metal-sash fixed windows covered by a projecting stucco clad flat roof (Photograph 3). All fenestration is recessed on the elevations. A CMU wall extends along the rear (west) and south elevations west. As such, only the primary (east) and north elevations were visible during the survey. Visible alterations to the building since it was constructed include window and door replacements on the north elevation (dates unknown).

***B10. Significance**

The following historic context is adapted from the *Built Environment Inventory and Evaluation Report for the Covina Reliability Project* prepared in March 2025 by Dudek.

Historical Overview of the City of Covina

Covina was established in 1885 in the San Gabriel Valley about 22 miles east of Los Angeles (City of Covina 2023a). During the Spanish period in the 1770s, the area was part of Rancho La Puente that supported the San Gabriel Mission (Homestead Museum 2023). In 1822, the political situation changed as Mexico won its independence from Spain, and the San Gabriel Valley region became part of the Mexican Republic. Rancho La Puente was passed into private ownership for several years until the land was granted to John Rowland in 1842 (Homestead Museum 2023). After Rowland's death in 1873, his wife sold 5,500-acres of the ranch to Julian and Antonia Badillo. The Badillo's sold their land to the Hollenbecks, who sold about 2,000-acres of the ranch to Joseph Swift Philips in 1883 (Town Square Publications 2023). Philips subdivided the land for the development of the town of Covina. In January 1885, the Phillips tract officially opened for sale and the first issue of the *Covina Independent* was published (Broadwell 2022).

The fertile soil in the area lent itself to a successful agricultural industry that encouraged settlers to move to Covina. Additionally, the Southern Pacific Railroad and Pacific Electric Streetcar developed railroads through the city, aiding in the growth of the population and the transportation of the local produce. By 1901, the city was incorporated and had become the largest shipper of citrus in Los Angeles County at the time. The citrus industry continued to dominate the city's economy throughout the early twentieth century until the end of World War II (City of Covina 2023b: 1).

As the nation entered World War II, the area's sparsely populated agricultural landscape rapidly transformed into a residential center that continued to develop during the post-war years (City of Covina 2023b: 1). The population of Covina increased over 400% between 1950 and 1960, and historic aerial photographs from the period show that suburbanization overtook the remaining agricultural areas (City of Covina 2023b: 1; NETR 2025a). Although the city was focused on residential growth throughout the 1950s, the city saw more institutional and commercial growth during the 1960s. Historic aerial photographs show the construction of the Project site, as well as the industrial properties directly north, east, and south of the Project site, between 1954 and 1964. Further industrial development in the surrounding area is visible in aerial photographs between 1964 and 1977 (NETR 2025a). Examples of nearby industrial buildings constructed in this period include 545 E Edna Place (1957), 515 E. Edna Place (1961), and 565 E. Edna Place (1963) on the north side of Edna Place across from the Project site, as well as 576 E. Edna Place (1961) directly east of the Project site (ParcelQuest 2025).

The 1970s were a period of slower growth and development than the previous decades since much of the city's infrastructure had been established during the 1950s and 1960s (Covina Past 2015). Throughout the late 1970s to the 1990s, Covina's economy was dominated by commercial industries (City of Covina 2023b: 1). Today, the City of Covina is primarily composed of residential properties and continues to thrive in its commercial industries. The current population stands at about 47,914 residents (World Population Review 2025).

NRHP/CRHR Evaluation

Archival research did not find any direct associations between 522 E. Edna Place and events that have made a significant contribution to the broad patterns of our history. The industrial building was constructed in 1960 during a period of increased industrial development in Covina. The city experienced an exponential population increase between 1950 and 1960. This population growth was reflective of both state-wide trends in the decades following World War II's conclusion in 1945, as well as a shift in the region's predominately agricultural economy to one that included additional industries. Development of the San Bernardino Freeway in 1954 further facilitated accessibility to the region that allowed for more efficient transportation of goods from Covina to the wider Los Angeles County area. The subject property is generally associated with Covina's industrial development during 1950s and 1960s. However, a mere association with this trend is not sufficient to meet NRHP Criterion A or CRHR Criterion 1. Research also did not identify a significant historical event that occurred on the subject property. Therefore, 522 E. Edna Place is not eligible under NRHP Criterion A or CRHR Criterion 1.

Archival research did not indicate that 522 E. Edna Place has a direct association with individuals who made a significant contribution to history at the national, state, or local level. The earliest identified owner of the subject property was Louis Frye from 1958 to 1959, and Edwin Begin from 1959 to 1960. The building was subsequently occupied by short-term owners/occupants until c. 2023 when the current owner, Bory Brothers LLC, purchased the property (ParcelQuest 2025). Research did not identify additional individuals associated with the identified business and did not uncover information that would indicate that any of the owners/occupants made a significant contribution to history. Due to a lack of identified significant associations with any persons important in our past, 522 E. Edna Place is not eligible under NRHP Criterion B or CRHR Criterion 2.

The building is a modest and architecturally undistinguished example of an industrial building constructed in 1960 with no particular style. It is a ubiquitous example of the type and there are many similar examples in Covina, Los Angeles County, California, and the United States. The building is not the work of a notable architect or builder, and archival research failed to reveal substantial information about the contractor of the property, Edwin A. Begin. Likewise, the building appears to have been constructed through already well-documented and common construction techniques and methods and does not possess high artistic values by articulating a particular concept of design to the extent that they express an aesthetic ideal. The last portion of Criterion C refers to a district, which is defined as a significant and distinguishable entity whose components may lack individual distinction. The subject property does not contribute to the significance of a potential or existing historic district. Overall, 522 E. Edna Place lacks sufficient design and construction value to meet NRHP Criterion C or CRHR Criterion 3.

The building is not significant as a source, or likely source, of important historical information, nor does it appear likely to yield important information about historic construction methods, materials, or technologies. This technology is well understood through contemporary trade journals and scientific monographs. As such, the subject property lacks significance under NRHP Criterion D or CRHR Criterion 4.

City of Covina Evaluation

As discussed in NRHP/CRHR Criteria A/1 research does not indicate that the subject property was associated with a special element of the city's cultural, social, economic, political, aesthetic, engineering, architectural or natural history. The subject property is located in a portion of Covina that experienced steady industrial growth through the 1950s and 1960s. It does not appear to be associated with any developmental trends significant to the history of Covina, California, or the United States. Research did not identify the subject property as being the site of a significant historical event. Therefore, it does not meet eligibility requirements for City of Covina Criterion 1.

As discussed in NRHP/CRHR B/2, research does not indicate that the subject property was associated with persons or events significant in local, state, or national history. Therefore, it is not eligible under City of Covina Criterion 2.

As discussed in NRHP/CRHR Criterion C/3, the subject property does not appear to be representative of the work of a notable builder, designer, or architect. Therefore, it is not eligible under City of Covina Criterion 3.

As discussed in NRHP/CRHR Criterion C/3, the subject property does not embody distinctive characteristics of a style, type, period, or method of construction, or are valuable examples of the use of indigenous materials or craftsmanship. The building is a ubiquitous typology found throughout Covina, California, and the nation. Therefore, it is not eligible under City of Covina Criterion 4.

The subject property does not contribute to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development. Although the building is located within an industrial area of the city, the subject property is not a significant example of industrial development from the late 1950s. Likewise, it was not constructed as part of a grouping of properties that contribute to each other or are unified aesthetically by plan or physical development. Development of the property simply followed an already existing pattern of industrial development in the area. The subject property is a utilitarian industrial building and does not contribute to a concentration of historic or scenic properties, nor a thematically related grouping of properties unified by plan or physical development. Furthermore, it does not contribute to the City's two districts: the Downtown Commercial District (designated in 2007) and the Cottage Drive Historic District (designated in 2007) (HPP 2007: Appendix B). Therefore, the subject property does not meet eligibility requirements for City of Covina Criterion 5.

As discussed in NRHP/CRHR Criterion C/3, the subject property is not one of the few remaining examples in the city of Covina, region, state, or nation possessing distinguishing characteristics of an architectural or historic type or specimen. It does not contain enough distinguishing characteristics of an architectural or historic type or specimen to be considered a significant example of its style or type. The subject property is a ubiquitous typology and is not one of the few remaining examples in the city, region, state, or nation. Therefore, it is not eligible under City of Covina Criterion 6.

Integrity Considerations

Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. Because the subject property lacks sufficient significance to meet any of the criteria for listing in the NRHP, CRHR, or the City of Covina Historic Resources Inventory, an integrity analysis is immaterial for 522 E. Edna Place.

Summary of Evaluation Findings

Dudek concludes that the subject property is not eligible for listing in the NRHP CRHR, or the City of Covina Historic Resources Inventory due to a lack of significant associations and architectural merit. The recommended California Historical Resource Status Code for the property is 6Z, meaning it was found ineligible for the NRHP, CRHR, or the City of Covina Historic Resources Inventory through survey evaluation.

The subject property at 578 E. Edna Place (AIN 8429-008-800) contains the Southern California Edison (SCE) Cortez Substation constructed c. 1964 by the SCE Company (NETR 2024). The SCE Cortez Substation consists of one building and power infrastructure including high voltage transmission towers, lightning arrestors, switchgear, transformers, busbars, and shield wires (Photograph 2). The one-story rectangular in plan building on the southwest corner of the property is clad with painted concrete and has a flat roof with wide overhanging eaves (Photograph 3). A single-panel metal door is located on the west elevation. See Continuation Sheet.

578 E. Edna Place does not meet the criteria for the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR) or the City of Covina Historic Resources Inventory. The property was evaluated in accordance with Section 15064.5 (a)(2)-(3) of the CEQA Guidelines using the criteria outlined in Section 5024.1 of the California Public Resources Code. The property is not considered a historical resource under CEQA. As such, this evaluation assigns a 6Z California Historical Resources Status Code to 578 E. Edna Place. See Continuation Sheet.

***P3a. Description**

The property is covered with crushed-stone gravel and is accessed by an asphalt driveway along the western boundary of the property leading south from E. Edna Place. Chain-link fencing encases the perimeter of the property. Only partial views of property were visible from the public right-of-way during the survey.

***B10. Significance**

The following historic context is adapted from the *Built Environment Inventory and Evaluation Report for the Covina Reliability Project* prepared in March 2025 by Dudek.

Historical Overview of the City of Covina

Covina was established in 1885 in the San Gabriel Valley about 22 miles east of Los Angeles (City of Covina 2023a). During the Spanish period in the 1770s, the area was part of Rancho La Puente that supported the San Gabriel Mission (Homestead Museum 2023). In 1822, the political situation changed as Mexico won its independence from Spain, and the San Gabriel Valley region became part of the Mexican Republic. Rancho La Puente was passed into private ownership for several years until the land was granted to John Rowland in 1842 (Homestead Museum 2023). After Rowland's death in 1873, his wife sold 5,500-acres of the ranch to Julian and Antonia Badillo. The Badillo's sold their land to the Hollenbecks, who sold about 2,000-acres of the ranch to Joseph Swift Philips in 1883 (Town Square Publications 2023). Philips subdivided the land for the development of the town of Covina. In January 1885, the Phillips tract officially opened for sale and the first issue of the *Covina Independent* was published (Broadwell 2022).

The fertile soil in the area lent itself to a successful agricultural industry that encouraged settlers to move to Covina. Additionally, the Southern Pacific Railroad and Pacific Electric Streetcar developed railroads through the city, aiding in the growth of the population and the transportation of the local produce. By 1901, the city was incorporated and had become the largest shipper of citrus in Los Angeles County at the time. The citrus industry continued to dominate the city's economy throughout the early twentieth century until the end of World War II (City of Covina 2023b: 1).

As the nation entered World War II, the area's sparsely populated agricultural landscape rapidly transformed into a residential center that continued to develop during the post-war years (City of Covina 2023b: 1). The population of Covina increased over 400% between 1950 and 1960, and historic aerial photographs from the period show that suburbanization overtook the remaining agricultural areas (City of Covina 2023b: 1; NETR 2025). Although the city was focused on residential growth throughout the 1950s, the city saw more institutional and commercial growth during the 1960s. Historic aerial photographs show the construction of the Project site, as well as the industrial properties directly north, east, and south of the Project site, between 1954 and 1964. Further industrial development in the surrounding area is visible in aerial photographs between 1964 and 1977 (NETR 2025). Examples of nearby industrial buildings constructed in this period include 545 E Edna Place (1957), 515 E. Edna Place (1961), and 565 E. Edna Place (1963) on the north side of Edna Place across from the Project site, as well as 576 E. Edna Place (1961) directly east of the Project site (ParcelQuest 2025).

The 1970s were a period of slower growth and development than the previous decades since much of the city's infrastructure had been established during the 1950s and 1960s (Covina Past 2015). Throughout the late 1970s to the 1990s, Covina's economy was dominated by commercial industries (City of Covina 2023b: 1). Today, the City of Covina is primarily composed of residential properties and continues to thrive in its commercial industries. The current population stands at about 47,914 residents (World Population Review 2025).

Southern California Edison Company History

The SCE is a subsidiary company of Edison International and is the largest electrical supply company in Southern California. Edison International was formed by the merger and acquisition of smaller electrical companies in 1886. As the population of Los Angeles steadily increased during the late 1890s, the need for power grew. Several businessmen in Los Angeles formed the Westside Lighting Company, later known as the SCE, as a subsidiary of Edison International to address residents' needs. By 1907, Edison Electric completed construction of the Kern River Hydro Powerhouse and began producing power to the Los Angeles Basin with a 75 kV transmission line, the highest voltage in the nation at the time (EI 2023; SCE 2023).

In 1912, the Los Angeles Water Department began extending its operations to include hydroelectric generation and local electricity distribution after the Los Angeles City Council voted to begin negotiations to purchase local electrical facilities. Between 1922 and 1937, SCE sold its hydroelectric facilities to the city. However, its loss of business was offset by the suburban growth of Los Angeles County. With more energy generation needed throughout the area, SCE created a transmission line with the capacity to retain 220 kV by 1922. In 1926, SCE completed construction of the largest multiple-arch dam in the world at the time, the Florence Lake Dam. The groundbreaking design reduced the amount of concrete needed to be carried up the mountains. In 1939, the SCE received its share of power from the Hoover Dam after completing a 220 kV transmission to the dam (EI 2023).

During the outbreak of World War II, Edison International collected scraps of materials from their plants, such as rubber, copper, iron, steel, and brass to donate to the war effort. Additionally, SCE engineers helped design the electrical system for a plutonium extraction facility to develop nuclear weapons for the war. By 1946, the country established a standard for electricity that required a currently alternating at sixty cycles per second. To accommodate the new standard, SCE changes its fifty-cycle system to a sixty-cycle system, requiring a massive rewiring program taking nearly three years to complete (EI 2023).

During the 1960s, SCE continued to expand their facilities. By 1968, SCE completed construction of the 450-megawatt San Onofre Nuclear Generation Station Unit 1, and between 1967 and 1970, they built the Pacific AC-DC Intertie, the first major high-voltage DC line in the country capable of transporting 8,000 megawatts of power. The rising cost of fossil fuel during the 1970s led to SCE's interest in producing renewable energy technologies to generate alternative power. Throughout the 1970s and 1980s, the SCE research, development, and demonstration department research cutting-edge power development. In 1980, the SCE CEO William R. Gould, announced the company's initiative to develop 2,000 megawatts of alternative and renewable energy. Along with the department of energy and the Los Angeles Department of Water and Power, SCE developed a solar thermal plant in the Mojave Desert during the 1980s that began operating by 1996 (EI 2023).

The California energy crisis of the early 2000s saw the price of independent power rise. As a result, SCE purchased abandoned plants through Southern California to relieve power shortages. To alleviate power costs, SCE began construction of the first transmission line to only carry renewable power with the Tehachapi Renewable Transmission line in 2007. Likewise, in 2008, SCE launched their solar photovoltaic rooftop program to promote the addition of solar panels to buildings. Today SCE owns over 104,000 miles of circuits across its service territory. SCE maintains its infrastructure with individually constructed substations that distribute electricity throughout the area through transmission lines (EI 2023; SCE 2023).

Substation Typology

Substations disseminate electricity that is transmitted from a generating facility. The primary function of a substation is the conversion of electrical currents between voltages and circuits. As transmission lines carry electrical circuits to the substation, switchgears carry the current to transformers that convert the current to the desired voltage (PG&E 2020: 4.21). Substation design includes structures such as the intake from high-voltage transmission lines, transformers, switchgear, shield wires, and lightning arrestors that divert lightning to the ground through towers (Kramer 2012: 49). There are three types of substations: a step-up transmission substation, a step-down transmission substation, and a distribution substation. As described in SCE's *Historic-Era Electrical Infrastructure Management Program:*

> The step-up type receives power from a nearby generating facility and uses a large power transformer to increase the voltage for transmission to distant locations. The stepdown type serves as switching points wherein the transmitted voltage may be reduced to a sub transmission level and further transmitted to customers via the electrical grid. The distribution substation type is the end-user facility that connects to local customers at varying low-voltage levels. Substations are designed to fulfill all or some of the following functions (Tinsley Becker 2017: 65):
>
> - Change voltage from one level to another,
> - Regulate voltage to compensate for system voltage changes,
> - Switch transmission and distribution circuits into and out of the grid system,
> - Measure electric power qualities flowing in the circuits,
> - Connect communication signals to the circuits,
> - Eliminate lightning and other electrical surges from the system,
> - Connect electric generation plants to the system,
> - Make interconnections between the electric systems of more than one utility, and
> - Control reactive kilovolt-amperes supplied to and the flow of reactive kilovolt amperes in the circuits.

Early SCE substations in Southern California, constructed between c. 1909 and the 1930s, were often designed in architectural styles associated with the time such as the Classical Revival, Mission Revival, and Spanish Revival. These substations were primarily constructed as stand-alone structures containing engineering equipment. By the 1940s, shortages of material due to World War II resulted in substations constructed with no particular style or decoration. As a result, SCE promoted more utilitarian style substations that could be efficiently built to contain equipment and were void of stylistic details. Before 1950, SCE had installed approximately 150 substations. In 1950, SCE acquired or developed approximately 401 additional substations, and the company's portfolio continued to steadily increase in subsequent decades (Tinsley Becker et al. 2015: 13).

In 2015, the SCE developed a typology for its historic-era substations categorized by the types of buildings they resemble defined six types of substations: Monumental, Commercial, Residential, Civic, Religious, and Astylistic. Monumental type substations do not resemble a property type but rather reflect a substantial presence through their scale, massing, and formal appearance. These substations are properties constructed with an emphasis on architectural value and aesthetics. There are three subtypes of the Monumental type: the Block, Box, and Multi-Part subtypes. The Block subtype consists of buildings that are over three stories with bays of windows

and overhangs. The Box subtype consists of rectangular in plan buildings with either a cornice or recessed panels. The Multi-Part subtype is organized in two to three parts and features the Classical Revival style or classical elements such as pediments and piers. Commercial types resemble buildings for businesses and were often constructed in Period Revival styles. There are three subtypes, banks, offices, and retail. The Commercial subtype is primarily used in commercial areas to disguise the appearance of electrical infrastructure substations. The Residential type refers to substations designed to look like single or multi-family residences in residential neighborhoods. There are three subtypes, apartments, bungalows, and cottages. Civic substations are the most common types of substations and typically reflect Classical Revival style brick buildings. There are four subtypes, three of which resemble libraries and one that resembles post offices. Religious type substations are the least common and often resemble Spanish Colonial Revival style churches. They do not have any subtypes. Lastly, Asytlistic type substations are defined as substations that are not architecturally significant but may be historically significant for other reasons (for example, their association with a historical event or for innovation in engineering). During the 1940s, SCE substations were void of ornamentation or architectural style and this utilitarian approach to substation development continued for the succeeding decades. SCE no longer attempted to disguise its power infrastructure with buildings and instead left structures exposed with smaller buildings to contain equipment (SCE 2023; Tinsley Becker et al. 2015: 14). There are four subtypes: Steel 1, Steel 2, Brick, and Concrete (Tinsley Becker et. al. 2017: 7-99).

NRHP/CRHR Evaluation

Electrical substations are a necessary component of electrical infrastructure and play an important role in facilitating a city's economic and physical growth. The SCE Cortez Substation was constructed c. 1964, to provide electrical service during a period of increased development in the city. Although serving an important function, the SCE Cortez Substation is one of many substations developed in the 1950s and 1960s by the SCE Company that represents the expansion of already-existing electrical infrastructure network in the region following World War II. Before 1950, for example, the SCE Company had installed approximately 150 substations. In 1950, they acquired or developed approximately 401 additional substations, and the company's portfolio continued to steadily increase in subsequent decades (Tinsley Becker et al. 2015: 13). Research also did not identify a significant historical event that occurred at the SCE Cortez Substation. As such, the subject property represents a continuation of a decades-long pattern of the SCE Company's electrical infrastructure expansion in the region that accelerated to accommodate post-World War II residential, commercial, and industrial growth. Therefore, the SCE Cortez Substation is not eligible under NRHP Criterion A or CRHR Criterion 1.

Research did not identify any individuals associated with the SCE Cortez Substation. Since its construction c. 1964, the SCE Cortez Substation has been owned by the SCE Company. Due to a lack of identified significant associations with any persons important in our past, the subject property is not eligible under NRHP Criterion B or CRHR Criterion 2.

The SCE Cortez Substation and associated structures are utilitarian in design and lack the distinctive characteristics of a particular type, period, or method of construction. It is an example of an Astylistic substation, which were constructed post-World War II. Astylistic type substations are defined by the *Historic-Era Electrical Infrastructure Management Program* document as substations that are not architecturally significant. The Cortez Substation was constructed through already well-documented and common construction techniques and research indicates that it was not technologically or materially innovative within the history of electrical substations. Archival research did not identify an architect, designer, or builder indicating it is not the work of a master architect or engineer. The last portion of Criterion C refers to a district, which is defined as a significant and distinguishable entity whose components may lack individual

distinction. The SCE Cortez Substation does not contribute to the significance of a potential or existing historic district. Overall, the property lacks sufficient design and construction value to meet NRHP Criterion C or CRHR Criterion 3.

The subject property is not significant as a source, or likely source, of important historical information, nor does it appear likely to yield important information about historic construction methods, materials, or technologies. This technology is well understood through contemporary trade journals and scientific monographs. As such, the subject property lacks significance under NRHP Criterion D or CRHR Criterion 4.

City of Covina Evaluation

As discussed in NRHP/CRHR Criteria A/1 research does not indicate that the subject property was associated with a special element of the city's cultural, social, economic, political, aesthetic, engineering, architectural or natural history. The subject property is located in a portion of Covina that experienced steady industrial growth through the 1950s and 1960s. The subject property is not to be associated with any developmental trends significant to the history of Covina, California, or the United States. Research did not identify the subject property as being the site of a significant historical event. Therefore, it does not appear eligible under City of Covina Criterion 1.

As discussed in NRHP/CRHR B/2, research does not indicate that the subject property was associated with persons or events significant in local, state, or national history. Therefore, it is not eligible under City of Covina Criterion 2.

As discussed in NRHP/CRHR Criterion C/3, the subject property does not appear to be representative of the work of a notable builder, designer, or architect. The original building permits for the buildings were not on file with the City and additional research did not identify an architect or builder for the property. Therefore, it is not eligible under City of Covina Criterion 3.

As discussed in NRHP/CRHR Criterion C/3, the subject property does not embody distinctive characteristics of a style, type, period, or method of construction, or is a valuable example of the use of indigenous materials or craftsmanship. The building is a common example of an Astylistic substation, which is not considered architecturally significant. The subject property is a ubiquitous typology found throughout Covina, California, and the nation. Therefore, it is not eligible under City of Covina Criterion 4.

The property does not contribute to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development. The subject property is a SCE substation and, as such, it is neither a concentration of historic or scenic properties, nor a thematically related grouping of properties unified by plan or physical development. It does not contribute to the City's two districts: the Downtown Commercial District (designated in 2007) and the Cottage Drive Historic District (designated in 2007) (HPP 2007: Appendix B). The subject property does not appear to be part of a grouping of properties that contribute to each other and are unified aesthetically by plan or physical development. Therefore, it is not eligible under City of Covina Criterion 5.

As discussed in NRHP/CRHR Criterion C/3, the subject property is not one of the few remaining examples in the city of Covina, region, state, or nation possessing distinguishing characteristics of an architectural or historic type or specimen. It does not contain enough distinguishing characteristics of an architectural or historic type or specimen to be considered a significant example of its style or type. Furthermore, as an Astylistic substation it is not considered architecturally significant. The subject property is a ubiquitous typology and is not one of the few remaining examples

in the city, region, state, or nation. Therefore, it is not eligible under City of Covina Criterion 6.

Integrity Considerations

Integrity is the ability of a property to convey its significance. Because the concept of integrity is based on significance, the assessment of a property's integrity can only proceed after its significance has been fully established. Because the subject property lacks sufficient significance to meet any of the criteria for listing in the NRHP, CRHR, or the City of Covina Historic Resources Inventory, an integrity analysis is immaterial for 578 E. Edna Place.

Summary of Evaluation Findings

Dudek concludes that the subject property is not eligible for listing in the NRHP CRHR, or the City of Covina Historic Resources Inventory due to a lack of significant associations and architectural merit. The recommended California Historical Resource Status Code for the property is 6Z, meaning it was found ineligible for the NRHP, CRHR, or the City of Covina Historic Resources Inventory through survey evaluation.

Management Summary

This report presents the results of Dudek's cultural resources inventory and evaluation conducted for the Covina Reliability Project (Project), located in the City of Covina, Los Angeles County, California. The Project is located within Section 12 of Township 1 South and Ranges 9 West and 10 West of the *Baldwin Park*, California U.S. Geological Survey (USGS) 7.5 Minute Series Quadrangle (Figure 1, Project Location). The Project proposes to construct and operate a battery energy storage system (BESS).

The City of Covina (City) is the Lead Agency responsible for compliance with the California Environmental Quality Act (CEQA). In accordance with CEQA and local regulations, Dudek performed a cultural resources inventory that included a records search, an archival information and literature review, correspondence with the Native American Heritage Commission, and a cultural resources pedestrian survey.

Dudek conducted a California Historical Resources Information System (CHRIS) records search of the Project site and surrounding one-mile radius at the South Central Coastal Information Center (SCCIC). The records search identified one cultural resource within the Project site, P-19-187085, a historic-era route and a California Registered Historical Landmark. Additionally, three cultural resources including one prehistoric resource and two historic-era built environment resources were identified within one-mile of the Project site. A Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search was also requested for the Project, and results were negative for Native American cultural resources.

A Dudek archaeologist conducted an intensive-level pedestrian survey of the Project site on March 14, 2025. During the pedestrian survey, no archaeological resources were observed; however, no exposed soil was present as the entire Project site is developed and/or paved. A review of historical aerial imagery and historical topographic maps reveal that the Project site has been developed and/or paved with the present-day development since at least 1964, and prior to being developed the Project area was in use as an orchard. An updated California Department of Parks and Recreation (DPR) 523 Series form was prepared for previously recorded resource P-19-187085 and will be submitted to the SCCIC of the CHRIS at California State University, Fullerton.

Based on the previous disturbances within the Project site due to agriculture and development, there is a low potential to encounter intact cultural deposits containing archaeological and tribal cultural resources during Project implementation. However, in the event that archaeological resources are exposed during construction activities involving ground disturbance, the Project would have the potential to negatively affect archeological resources, which would be a significant impact under CEQA. Implementation of mitigation measures MM-CUL-1 Workers Environmental Awareness Program Training and MM-CUL-2 Inadvertent Discovery Treatment would reduce this impact to below a level of significance. Therefore, impacts to archeological resources would be less than significant with mitigation incorporated.

INTENTIONALLY LEFT BLANK

1 Introduction

In accordance with CEQA and local regulations, Dudek performed a cultural resources inventory that included a records search, an archival information and literature review, correspondence with the Native American Heritage Commission, and a cultural resources pedestrian survey.

1.1 Project Location and Description

The Project is located within Sections 12 of Township 1 South and Ranges 9 West and 10 West of the *Baldwin Park*, California USGS 7.5 Minute Series Quadrangle (Figure 1: Project Location). Specifically, the Project comprises two sites (east and west), with a total area of approximately 3.4 acres of private land, on Assessor's Parcel Numbers (APNs) 8429-008-029, 8429-008-028, 8429-007-007, 8429-007-006 and 8429-007-005 (Project site). The west site (APNs 8429-008-029 and 8429-008-028) is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses and associated surface parking. It is bordered directly to the east by the 1.32-acre SCE Cortez Substation on APN 8429-008-800, which occupies approximately 1.32 acres and is developed with electrical distribution infrastructure within a fenced and previously disturbed area. The SCE Cortez Substation is considered an off-site impact area associated with the Project, and therefore, is included in the Project site. The east site (APNs 8429-007-007, 8429-007-006 and 8429-007-005) is developed with a surface parking lot where recreational and commercial vehicles and boats are currently stored (Figure 1-1: Project Site).

The Project is designed to charge or discharge electricity to and from the grid via a battery energy storage system with associated on-site support components consisting of inverters, collector lines, fencing, access roads, supervisory control, a Supervisory Control and Data Acquisition (SCADA) system, and other ancillary facilities or equipment. The Project would include construction of an on-site Project substation on the west site, which will allow interconnection to the existing and adjacent Southern California Edison (SCE) Cortez Substation via an overhead generation transmission (gen-tie) line. To facilitate operation of the Project, SCE would make various improvements to the Cortez Substation. SCE's improvements would occur within areas previously disturbed and occupied by existing electrical facilities within and adjacent to the substation.

Battery Energy Storage System

The Project would include placement of battery energy storage enclosures and associated electrical equipment, including medium voltage transformers and power conversation systems. Each unit consists of a storage enclosure/non-occupiable steel cabinet that houses battery modules and power conversion system equipment. The battery storage units are prefabricated off site and arrive to the site fully assembled and ready to be installed and operated. The actual number of energy storage enclosures and types are approximate and subject to change based on available battery technology at the time of construction. Each battery energy storage enclosure would have insulation, a module cooling system, a battery management system, fire detection equipment, power conversion system (PCS) equipment containing the electronic controls, inverters, and a medium voltage step-up transformer. The primary storage components would consist of self-contained electrochemical battery systems using conventional storage technologies with proven safety and performance records. The BESS enclosures would be designed such that the periodic maintenance and replacement of underperforming battery components can be easily performed on an as-needed basis without replacing the entire module.

Project Substation

The Project substation would be the termination point of the 34.5-kilovolt (kV) medium voltage collection system. The power to and from the BESS would be passed through a final interconnection step-up transformer to convert it from 34.5kV to 66kV, which is the Project's interconnection voltage at the SCE Cortez Substation. The open-air Project substation would be on the southern portion of the west site adjacent to the SCE Cortez Substation.

Generation Transmission and Collection Lines

Gen-Tie Line – West Site

The energy would be transported to and from the Project substation to the adjacent SCE Cortez Substation through a gen-tie line. The 66kV gen-tie line would be installed above ground from an approximately 50-foot point of change over (POCO) pole located within the Project substation, travel overhead approximately 90 feet into the SCE Cortez Substation, where it would connect to a 39-foot tall 66kV dead end switchyard structure, as described further below under SCE Cortez Substation Improvements. The 50-foot gen-tie POCO pole would be constructed of steel and would be at a height that is consistent with the existing equipment within the SCE Cortez Substation and the existing transmission lines along East Edna Place.

Collection Line

The Project would include a 34.5kV below-ground collection (feeder) line that would connect the east site to the west site and substation. The collection line would extend from northeast corner of the east site, west along the south side of East Edna Place within a portion of the public right-of-way approximately 600 feet before turning south and interconnecting with the Project substation.

SCE Cortez Substation Improvements

In order to facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. Below is a summary of improvements to the SCE Cortez Substation:

- Install facilities for a new 66kV switchrack position to terminate the Project's gen-tie line within the SCE Cortez Substation. This work includes the following:
  - One (1) 39-foot tall 66kV dead end switchyard structure
  - Two (2) 66kV voltage transformers with steel pedestal support structures
  - Three (3) 66kV line drops
  - One (1) 66kV circuit breaker
  - Three (3) 66kV group operated disconnect switches, one with grounding equipment
  - Extend bus 1 position to the west within the SCE Cortez Substation fence line
  - 200 feet of conductor from the 39-foot tall 66kV dead end structure within the SCE Cortez Substation to the Project's point of change in ownership location outside SCE Cortez Substation fence line.
- Install telecommunications facilities:

- Approximately 150 feet of underground fiber optic cable and one (1) vault would extend fiber optic cable to the communications room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
- Approximately 150 feet of underground fiber optic cable and one (1) vault would extend the Project's diverse telecommunications into the communication room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
- Lightwave, channel, and associated equipment (including terminal equipment), supporting protection, remote terminal unit and SCADA requirements at the Project and SCE Cortez Substation.

2 Regulatory Setting

2.1 State Requirements

The California Register of Historical Resources

A cultural resource is considered "historically significant" under CEQA if the resource meets one or more of the criteria for listing on the California Register of Historical Resources (CRHR). The CRHR was designed to be used by state and local agencies, private groups, and citizens to identify existing cultural resources within the state and to indicate which of those resources should be protected, to the extent prudent and feasible, from substantial adverse change. The following criteria have been established for the CRHR. A resource is considered significant if it:

1. is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. is associated with the lives of persons important in our past;
3. embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the above criteria, historical resources eligible for listing in the CRHR must retain enough of their historic character or appearance to be able to convey the reasons for their significance. Such integrity is evaluated in regard to the retention of location, design, setting, materials, workmanship, feeling, and association.

Under CEQA, if an archeological site is not a historical resource but meets the definition of a "unique archeological resource" as defined in PRC Section 21083.2, then it should be treated in accordance with the provisions of that section. A unique archaeological resource is defined as follows:

- An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
    - Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information
    - Has a special and particular quality, such as being the oldest of its type or the best available example of its type
    - Is directly associated with a scientifically recognized important prehistoric or historic event or person

Resources that neither meet any of these criteria for listing in the CRHR nor qualify as a "unique archaeological resource" under CEQA (PRC Section 21083.2) are viewed as not significant. Under CEQA, "A non-unique archaeological resource need be given no further consideration, other than the simple recording of its existence by the lead agency if it so elects" (PRC Section 21083.2[h]).

Impacts that adversely alter the significance of a resource listed in or eligible for listing in the CRHR are considered a significant effect on the environment. Impacts to historical resources from a Project are thus considered significant if the project (1) physically destroys or damages all or part of a resource; (2) changes the character of the use of the resource or physical feature within the setting of the resource, which contributes to its significance; or (3) introduces visual, atmospheric, or audible elements that diminish the integrity of significant features of the resource.

California State Assembly Bill 52

Assembly Bill 52 of 2014 (AB 52) amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

Consultation with Native Americans

AB 52 formalizes the consultation process between lead agencies and tribal representatives, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with a project area. This includes tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Tribal Cultural Resources

Section 4 of AB 52 adds Sections 21074 (a) and (b) to the PRC, addressing tribal cultural resources (TCRs) and cultural landscapes. Section 21074 (a) defines tribal cultural resources as one of the following:

1. Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
   a. Included or determined to be eligible for inclusion in the California Register of Historical Resources.
   b. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on tribal cultural resources should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

Native American Historic Cultural Sites

The Native American Historic Resources Protection Act (California Public Resources Code Section 5097, et seq.) addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NRHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

CEQA

As described further, the following CEQA statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; CEQA Guidelines Section 15064.5(b)). If a site is listed or eligible for listing in the CRHR, or included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following:

(1) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

(2) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(3) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA (CEQA Guidelines Section 15064.5(b)(2)).

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

(2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC Section 21083.2(g)).

Impacts on nonunique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a nonunique archaeological resource qualifies as a TCR (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC Section 5097.98.

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the county coroner has examined the remains (Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact NAHC within 24 hours (Section 7050.5(c)). NAHC will notify the "most likely descendant." With the permission of the landowner, the most

likely descendant may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the most likely descendant by NAHC. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains, and items associated with Native Americans.

2.2 Local Regulations

City of Covina Municipal Code – Section 17.81.050 Historic Designation Criteria

The City of Covina's Municipal Code from September 3, 2024, also known as the City's Historic Preservation Ordinance, establishes the eligibility criteria for landmarks and historic districts within Covina. Ordinance Chapter 17.81 identifies that any archaeological site, natural feature or property that has special historical, cultural, aesthetic, or architectural character, interest, or value as part of the development, heritage, or history of the city of Covina are eligible for local designation if they meet any or all of the following criteria:

1. It exemplifies or reflects special elements of the city's cultural, social, economic, political, aesthetic, engineering, architectural or natural history; or

2. It is identified with persons or events significant in local, state, or national history; or

3. It represents the work of a notable builder, designer, or architect; or

4. It embodies distinctive characteristics of a style, type, period, or method of construction, or is a valuable example of the use of indigenous materials or craftsmanship; or

5. It contributes to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development; or

6. It is one of the few remaining examples in the City of Covina, region, state, or nation possessing distinguishing characteristics of an architectural or historic type or specimen.

3 Setting and Context

3.1 Environmental

The Project site is located in the San Gabriel Valley, northwest of the San Jose Hills, within the City of Covina in Los Angeles County, California as depicted on the *Baldwin Park*, California USGS 7.5 Minute Series Quadrangle. The closest prehistoric water source would have been the San Dimas Wash, which was located approximately 0.75 miles northwest of the Project site. Elevation throughout the Project site ranges from around 595 to 605 feet above mean sea level (amsl). The Project site is completely developed and/or paved; no native vegetation is present within the Project site.

3.2 Prehistoric Context

Evidence for continuous human occupation in Southern California spans the last 10,000 years. Various attempts to parse out variability in archaeological assemblages over this broad period have led to the development of several cultural chronologies; while some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. To be more inclusive, this research employs a common set of generalized terms used to describe chronological trends in assemblage composition: Paleoindian (pre-5500 BC), Archaic (8000 BC–AD 500), Late Prehistoric (AD 500–1769), and Ethnohistoric (post-AD 1769).

Paleoindian Period (pre-5500 BC)

Evidence for Paleoindian occupation in the region is tenuous. Our knowledge of associated cultural pattern(s) is informed by a relatively sparse body of data that has been collected from within an area extending from coastal San Diego, through the Mojave Desert, and beyond. One of the earliest dated archaeological assemblages in the region is located in coastal Southern California (though contemporaneous sites are present in the Channel Islands) derives from SDI-4669/W-12 in La Jolla. A human burial from SDI-4669 was radiocarbon dated to 9,590–9,920 years before present (95.4% probability) (Hector 2006). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of ground stone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian assemblages include large-stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1978) on Naval Air Weapons Station China Lake near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (MNO-679)—a multi-component fluted point site, and MNO-680—a single component Great Basined Stemmed point site (see Basgall et al. 2002). At MNO-679 and -680, ground stone tools were rare while finely made projectile points were common.

Warren et al. (2004) claimed that a biface (prehistoric stone tool that has been flaked on both faces), manufacturing tradition present at the Harris site complex (SDI-149) is representative of typical Paleoindian occupation in the region that possibly dates between 10,365 and 8,200 BC (Warren et al. 2004). Termed San Dieguito (see also Rogers 1945), assemblages at the Harris site are qualitatively distinct from most others in region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (see also Warren 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987) suggested that the San Dieguito pattern is simply an inland manifestation of a broader economic pattern. Gallegos's interpretation of San Dieguito has been widely accepted in recent years, in part because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree

of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

San Dieguito sites are rare in the inland valleys, with one possible candidate, RIV-2798/H, located on the shore of Lake Elsinore. Excavations at Locus B at RIV-2798/H produced a toolkit consisting predominantly of flaked stone tools, including crescents, points, and bifaces, and lesser amounts of groundstone tools, among other items (Grenda 1997). A calibrated and reservoir-corrected radiocarbon date from a shell produced a date of 6630 BC. Grenda (1997) suggested this site represents seasonal exploitation of lacustrine resources and small game and resembles coastal San Dieguito assemblages and spatial patterning.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in Southern California deserts, where hunting-related tools were replaced by processing tools during the early Holocene (see Basgall and Hall 1990).

Archaic Period (8000 BC–AD 500)

The more than 2,500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in Southern California. If San Dieguito is the only recognized Paleoindian component in coastal Southern California, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004) admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the region (see Hale 2001, 2009).

The Archaic pattern, which has also been termed the Millingstone Horizon (among others), is relatively easy to define with assemblages that consist primarily of processing tools, such as millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the region with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (see Basgall and Hall 1990; Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous amounts of archaeological work at Archaic sites, little change in assemblage composition occurred until the bow and arrow was adopted around AD 500, as well as ceramics at approximately the same time (Griset 1996; Hale 2009). Even then, assemblage formality remained low. After the bow was adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decreased in proportion relative to expedient, unshaped ground stone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complemented only by the addition of the bow and ceramics.

Late Prehistoric Period (AD 500–1769)

The period of time following the Archaic and before Ethnohistoric times (AD 1769) is commonly referred to as the Late Prehistoric (Rogers 1945; Wallace 1955; Warren et al. 2004); however, several other subdivisions continue to be used to describe various shifts in assemblage composition. In general, this period is defined by the addition of arrow points and ceramics, as well as the widespread use of bedrock mortars. The fundamental Late Prehistoric assemblage is very similar to the Archaic pattern but includes arrow points and large quantities of fine debitage from producing arrow points, ceramics, and cremations. The appearance of mortars and pestles is difficult to place in time because most mortars are on bedrock surfaces. Some argue that the Ethnohistoric intensive acorn economy

extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred before AD 1400. Millingstones and handstones persisted in higher frequencies than mortars and pestles until the last 500 years (Basgall and Hall 1990); even then, weighing the economic significance of millingstone-handstone versus mortar-pestle technology is tenuous due to incomplete information on archaeological assemblages.

3.2.1 Ethnographic Overview

The history of the Native American communities prior to the mid-1700s has largely been reconstructed through later mission-period and early ethnographic accounts. The first written records of the Native American inhabitants of the region come predominantly from European merchants, missionaries, military personnel, and explorers. These brief, and generally peripheral, accounts were prepared with the intent of furthering respective colonial and economic aims and were combined with observations of the landscape. They were not intended to be unbiased accounts regarding the cultural structures and community practices of the newly encountered cultural groups. The establishment of the missions in the region brought more extensive documentation of Native American communities, though these groups did not become the focus of formal and in-depth ethnographic study until the early twentieth century (Bean and Shipek 1978; Boscana 1846; Harrington 1934; Laylander 2000; Sparkman 1908; White 1963). The principal intent of these researchers was to record the precontact and culturally specific practices, ideologies, and languages that had survived the destabilizing effects of missionization and colonialism. This research, often understood as "salvage ethnography," was driven by the understanding that traditional knowledge was being lost due to the impacts of modernization and cultural assimilation. Alfred Kroeber applied his "memory culture" approach (Lightfoot 2005, p. 32) by recording languages and oral histories within the region. Ethnographic research by Dubois, Kroeber, Harrington, Spier, and others during the early twentieth century seemed to indicate that traditional cultural practices and beliefs survived among local Native American communities.

It is important to note that even though there were many informants for these early ethnographies who were able to provide information from personal experiences about native life before the Europeans, a significantly large proportion of these informants were born after 1850 (Heizer and Nissen 1973); therefore, the documentation of precontact, aboriginal culture was being increasingly supplied by individuals born in California after considerable contact with Europeans. As Heizer (1978) stated, this is an important issue to note when examining these ethnographies, since considerable culture change had undoubtedly occurred by 1850 among the Native American survivors of California.

Based on ethnographic information, it is believed that at least 88 different languages were spoken from Baja California Sur to the southern Oregon state border at the time of Spanish contact (Johnson and Lorenz 2006, p. 34). The distribution of recorded Native American languages has been dispersed as a geographic mosaic across California through six primary language families (Golla 2007).

Golla contended that one can interpret the amount of variability within specific language groups as being associated with the relative "time depth" of the speaking populations (Golla 2007, p. 80). A large amount of variation within the language of a group represents a greater time depth than a group's language with less internal diversity. One method that he has employed is by drawing comparisons with historically documented changes in Germanic and Romantic language groups. Golla observed that the "absolute chronology of the internal diversification within a language family" can be correlated with archaeological dates (2007, p. 71). This type of interpretation is modeled on concepts of genetic drift and gene flows that are associated with migration and population isolation in the biological sciences.

The tribes of this area have traditionally spoken Takic languages that may be assigned to the larger Uto–Aztecan family (Golla 2007, p. 74). These groups include the Gabrielino, Cahuilla, and Serrano. Golla interpreted the amount of internal diversity within these language-speaking communities to reflect a time depth of approximately 2,000 years. Other researchers have contended that Takic may have diverged from Uto–Aztecan ca. 2600 BC–AD 1, which was later followed by the diversification within the Takic speaking tribes, occurring approximately 1500 BC–AD 1000 (Laylander 2000).

Gabrielino/Tongva

Based on evidence presented through past archaeological investigations, the Gabrieliño appear to have arrived in the Los Angeles Basin around 500 BC. Surrounding native groups included the Chumash and Tataviam to the northwest, the Serrano and Cahuilla to the northeast, and the Juaneño and Luiseño to the southeast.

The names by which Native Americans identified themselves have, for the most part, been lost and replaced by those derived by the Spanish people administering the local Missions. These names were not necessarily representative of a specific ethnic or tribal group, and traditional tribal names are unknown in the post-Contact period. The name "Gabrieliño" or "Gabrieleno" was first established by the Spanish from the San Gabriel Mission and included people from the established Gabrieliño area as well as other social groups (Bean and Smith 1978; Kroeber 1925). Many modern Native Americans commonly referred to as Gabrieliño/Gabrieleno identify themselves as descendants of the Indigenous people living across the plains of the Los Angeles Basin. While distinct bands of the Indigenous people of Los Angeles Basin have adopted their own unique name, the term Gabrieliño is applied here.

The Gabrieliño established large, permanent villages along rivers and streams, and lived in sheltered areas along the coast. Gabrieliño lands included the greater Los Angeles Basin and three Channel Islands, San Clemente, San Nicolas, and Santa Catalina and stretched from the foothills of the San Gabriel Mountains to the Pacific Ocean. Tribal population has been estimated to be at least 5,000 (Bean and Smith 1978), but recent ethnohistoric work suggests a much larger population, approaching 10,000 (O'Neil 2002). Archaeological sites composed of villages with variously sized structures have been identified through the Los Angeles Basin. Within the permanent village sites, the Gabrieliño constructed large, circular, domed houses made of willow poles thatched with tule, each of which could hold upwards of 50 people (Bean and Smith 1978). Other structures constructed throughout the villages probably served as sweathouses, menstrual huts, ceremonial enclosures, and communal granaries. Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Gabrieliño villages (McCawley 1996).

The largest, and best documented, ethnographic Gabrieliño village in the vicinity was that of Yanga (also known as Yaangna, Janga, and Yabit), which was in the vicinity of the downtown Los Angeles (McCawley 1996:56-57; NEA and King 2004). This village was reportedly first encountered by the Portola expedition in 1769. In 1771, Mission San Gabriel was established. Yanga provided a large number of the recruitments to this mission; however, following the founding of the Pueblo of Los Angeles in 1781, opportunities for local paid work became increasingly common, which had the result of reducing the number of Native American neophytes from the immediately surrounding area (NEA and King 2004). Mission records indicate that 179 Gabrieliño inhabitants of Yanga were recruited to San Gabriel Mission (King 2000: 65; NEA and King 2004: 104). Based on this information, Yanga may have been the most populated village in the Western Gabrieliño territory. Second in size, and less thoroughly documented, the village of Cahuenga was located slightly closer, just north of the Cahuenga Pass.

The environment surrounding the Gabrieliño included mountains, foothills, valleys, deserts, riparian, estuarine, and open and rocky coastal eco-niches. Like most native Californians, acorns (the processing of which was established by the early Intermediate Period) were the staple food source. Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh water and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978:546; Kroeber 1925; McCawley 1996).

Tools and implements used by the Gabrieliño to gather and collect food resources included the bow and arrow, traps, nets, blinds, throwing sticks and slings, spears, harpoons, and hooks. Trade between the mainland and the Channel Islands Groups was conducted using plank canoes as well as tule balsa canoes. These canoes were also used for general fishing and travel (McCawley 1996).

The collected food resources were processed with hammerstones and anvils, mortars and pestles, manos and metates, strainers, leaching baskets and bowls, knives, bone saws, and wooden drying racks. Catalina Island steatite was used to make ollas and cooking vessels (Blackburn 1963; Kroeber 1925; McCawley 1996).

The Chinigchinich cult, centered on the last of a series of heroic mythological figures, was the basis of religious life at the time of Spanish contact. The Chinigchinich cult not only provided laws and institutions, but it also taught people how to dance, which was the primary religious act for this society. The Chinigchinich religion seems to have been relatively new when the Spanish arrived. It was spreading south into the Southern Takic groups even as Christian missions were being built. This cult may be the result of a mixture of native and Christian belief systems and practices (McCawley 1996).

Deceased Tongva were either buried or cremated, with inhumation more common on the Channel Islands and the neighboring mainland coast and cremation predominating on the remainder of the coast and in the interior (Harrington 1942; McCawley 1996). Cremation ashes have been found buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966), as well as scattered among broken ground stone implements (Cleland et al. 2007). Supporting this finding in the archaeological record, ethnographic descriptions have provided an elaborate mourning ceremony. Offerings varied with the sex and status of the deceased (Johnston 1962; McCawley 1996; Reid 1926). At the behest of the Spanish missionaries, cremation essentially ceased during the post-Contact period (McCawley 1996).

3.3 Historic Period

Post-Contact history for the state of California is generally divided into three periods: the Spanish Period (1769–1822), Mexican Period (1822–1848), and American Period (1848–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California began with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain, which took effect in California in 1822, marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican-American War, signals the beginning of the American Period, when California became a territory of the United States.

Spanish Period (1769–1822)

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrílo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrílo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica bays, giving each location its current name. The Spanish crown laid claim to California based on the surveys conducted by Cabrílo and Vizcaíno (Bancroft 1885:96–99; Gumprecht 1999:35).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the king of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

A major emphasis during the Spanish Period was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the Indigenous population.

Mexican Period (1822–1848)

After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955:14).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The secularization of the missions following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos. During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and spread of diseases foreign to the Native American population, who had no associated immunities.

American Period (1848–Present)

War in 1846 between Mexico and the United States brought U.S. Colonel Stephen Watts Kearny and part of his Army of the West from Kansas to California through present-day Imperial Valley. Lt. Colonel Philip St. George Cooke and the Mormon Battalion, following Kearny west to map a strategic wagon road through the territory, likewise moved through Imperial Valley. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo signed in 1848, ushering California into its American Period.

Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through the first decade of the Gold Rush, which began in 1848. With the influx of people seeking gold, cattle were no longer desired mainly for their hides, but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices, as operation of the huge ranchos became increasingly difficult, and as droughts severely reduced their productivity. The disruption of the Civil War and severe drought during the winters of 1862–1863 and 1863–1864 ruined many surviving ranchero families and resulted in the refocusing of grazing activities in southern California upon sheep (Beattie and Beattie 1939; Brown 1985; Ingersoll 1904).

During the Gold Rush, thousands of people traveled the Gila (or Southern Overland) Trail from Yuma to Temecula and on to Los Angeles. Thousands more traveled the Old Spanish Trail from Santa Fe across the Mojave Desert to Mission San Gabriel Arcángel and the Pueblo de Los Ángeles. Wagon roads and railroads constructed across the Colorado and Mojave deserts from the 1850s to the 1870s connected coastal California with the rest of the county. These modes of transport served to carry mail, prospectors, miners, entrepreneurs, merchants, immigrants, laborers, muleteers, settlers, and military personnel, as well as civilian and military supplies, livestock, produce, timber, and minerals produced by desert mines, among other necessities. The construction of permanent roadways across the desert trails and wagon roads accompanied the increased use of the automobile at the turn of the twentieth century. California became one of the United States with the Compromise of 1850, which also designated Utah and New Mexico (with present Arizona) as U.S. territories.

4 Background Research

4.1 Records Search

On February 17, 2025, Dudek conducted a search of the California Historical Resources Information System (CHRIS) at the SCCIC, located on the campus of California State University, Fullerton. The search included any previously recorded cultural resources and investigations within a one-mile radius of the Project site. The CHRIS search also included a review of the lists for the National Register of Historic Places (NRHP), the CRHR, the California Points of Historical Interest, the California Historical Landmarks, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. Results from the records search are provided in Confidential Appendix A.

4.1.1 Previously Conducted Cultural Resources Studies

The SCCIC records search identified ten previous cultural resources studies that have been conducted within a one-mile radius of the Project site. None of these studies overlap with the Project site. One study (LA-10641) is located adjacent to the Project site. Table 1, below, includes all cultural resource studies within one mile of the Project site, followed by a brief summary of the adjacent report.

Table 1. Previously Recorded Cultural Resources Studies within One Mile of Project Site

Report Number	Year	Title	Author
Outside Project Site			
LA-05001	2000	Negative Phase 1 Archaeological Survey of Approximately 0.5 Acres for the Senior Housing Creation Project 522 and 554 North Citrus Avenue Covina, California 91723	Maki, Mary K.

LA-13246A	2017	Addendum To: Historical Resource/Historic Property Analysis of the Covina Substation, City of Covina, Los Angeles County, California	Williams, Audry

Report No. LA-10641

Preliminary Historical/Archaeological Resources Study, San Bernadino Line Positive Train Control Project, Southern California Regional Rail Authority, Counties of Los Angeles and San Bernadino (Tang 2010), documents the results of a cultural resources study. The area of study consists of 56.2-miles of the railroad right-of-way, including the portion directly south of the Project site. The study included a records search, literature review, Native American outreach, and a reconnaissance survey. No cultural resources were identified within the Project site as a result of this study.

4.1.2 Previously Identified Cultural Resources

The SCCIC records search identified four previously recorded cultural resources within one mile of the Project site, one of which intersects with the Project site. The overlapping resource, P-19-187085, is a historic-era route and a California Registered Historical Landmark. Of the remaining three resources identified in the SCCIC records search, one is a prehistoric resource and two are historic-era built environment resources. Table 2. below, includes all cultural resources within one mile of the Project site, followed by a brief summary of the overlapping resource.

Table 2. Previously Recorded Cultural Resources within One Mile of Project Site

Primary Number	Trinomial	Age	Description	Eligibility Status	Recording Events
Inside the Project site					
P-19-187085	-	Historic-era	Mojave Road (CHL No. 963)	Listed on NRHP and CRHR	1989 (Elder) 2014 (Beherec)
Outside the Project site					
P-19-000329	CA-LAN-000329	Prehistoric	Site containing three mano fragments and three metate fragments, observed during construction activities	Not evaluated	1966 (Boon and Eberhart) 1966 (Eberhart and Wasson)

Table 2. Previously Recorded Cultural Resources within One Mile of Project Site

Primary Number	Trinomial	Age	Description	Eligibility Status	Recording Events
P-19-189466	-	Historic-era	The Covina Center for the Performing Arts	6Y: Determined ineligible for NR by consensus through Section 106 process - Not evaluated for CR or Local Listing	2011 (Loftus)
P-19-192461	-	Historic-era	Covina Substation	6Z: Found ineligible for NR, CR, or Local designation through survey evaluation	2015 (Loukianoff)

P-19-187085

P-19-187085, the Mojave Road, is a historic-era route that was utilized as a federal Government supply and mail route, a wagon route, a recreational trail, and a Native American trail. The Mojave Road covered approximately 300 miles across California, and connected Drum Barracks at Wilmington, California, to the Nevada State Line (Beherec 2014). As mapped, the Mojave Road intersects the eastern site of the Project site, APNs 8429-007-005, -006, and -007. The Mojave Road is a California Historical Landmark (no. 963) and is listed on the California Register of Historic Places. The portion of the Mojave Road that is located in San Bernardino County, is listed on the National Register of Historic Places.

4.2 Archival Research

4.2.1 Historical Aerial and Topographic Map Review

Dudek conducted an online review of historical aerial photographs (historic aerials or aerial images) and historical topographic maps (historic topos) to better understand the development of the Project site and surrounding vicinities over time. Historic aerials of the Project site available from 1948 to 2022 (NETR 2025). The first available historic aerial image from 1948 shows the Project site and surrounding area as orchards, with the railroad alignment located directly to the south of the Project site. The next available historic aerial shows the Project site as vacant land, the trees have been removed. The 1964 historic aerial shows the Project site as it appears present day, SCE Cortez Substation is present within APN 8429-008-800, there are structures within the western site of the Project site (APNs 8429-008-028 and -029), and the eastern site of the Project site (APNs 8429-007-005, -006, and -007) appears to be a parking lot. The roads currently known as East Edna Place and Barranca Avenue are present north and west of the Project site, respectively. The surrounding area is developed with residential and commercial properties. The 1965 to 2022 historic aerials do not show any changes to the Project site.

Historic topographic maps of the Project site are available from 1897 to 2021 (NETR 2025). The first available historic topo from 1897 depicts the Project site as undeveloped and the Southern Pacific Railroad is depicted approximately 490 feet south of the Project site. There are unlabeled roads located approximately 480 feet north and 815 feet east of the Project site. The Covina Canal is located approximately 0.30 miles east of the Project site, Walnut Creek is located approximately 1.25 miles southeast of the Project site, and San Dimas Wash is located approximately 0.75 miles northwest of the Project site. There are no changes to the Project site, as depicted in the

historic topos, until 1927. The 1927 historic topo depicts the Southern Pacific Railroad along the Project site's southern boundary. San Bernardino Road and Grand Avenue are present to the south and east, respectfully. By 1955 there is an increase of development to the north and the south, but there are no significant changes to the Project site. The 1967 historic topo depicts an increase of development surrounding the Project site; the road layout surrounding the Project site appears as it does present day. There are no structures depicted within the Project site. The 1975 to 2021 historic topos do not depict any changes to the Project site.

Overall, Dudek's review of historic aerial photographs and historic topographic maps reveals that the Project site has been developed with the current structures, and parking lot since at least 1964. The SCE Cortez Substation has also been present since at least 1964. Prior to its development, the Project site was used for agriculture, specifically as an orchard.

4.3 Review of Geomorphological Context

According to Natural Resources Conservation Service (NRCS) Web Soil Survey, soils within the Project site are comprised of Urban land-Palmview-Tujunga complex with 0 to 5 percent slopes (USDA 2025a). Urban land soils are associated with human-transported materials, human-altered materials, or minimally altered or intact "native" soils, and are present in developed area/areas of built environment (USDA 2023); no official soil description for Urban Land soils is available through the USDA. The Palmview Series soils consist of soils that formed in alluvium from granitic or related rock sources and generally occur at elevations ranging from 20 to 1,000 meters (65 to 3280 feet) on alluvial fans (USDA 2025b). The Tujunga Series consists of soils that formed in alluvium from granitic sources and generally occur at elevations ranging from 2 to 600 meters (6 to 1968 feet) on alluvial fans and floodplains, including urban areas (USDA 2025c). Alluvial soils are present within the Project site, which have a moderate potential for supporting the presence of subsurface archaeological deposits.

A review of the United States Geological Society mineral resources (USGS 2025) online spatial data for geology indicates that the Project site is comprised of one type of geologic unit. The entirety of the Project site is underlain by Quaternary alluvium and marine deposits, generally dating between the Pleistocene to Holocene. Late Pleistocene-era alluvial formations do have the potential to support the presence of buried archaeological resources. These soils are associated with the period of prehistoric human use, as well as represent ongoing processes of development that have potential to preserve cultural material in context, depending on area-specific topographical setting.

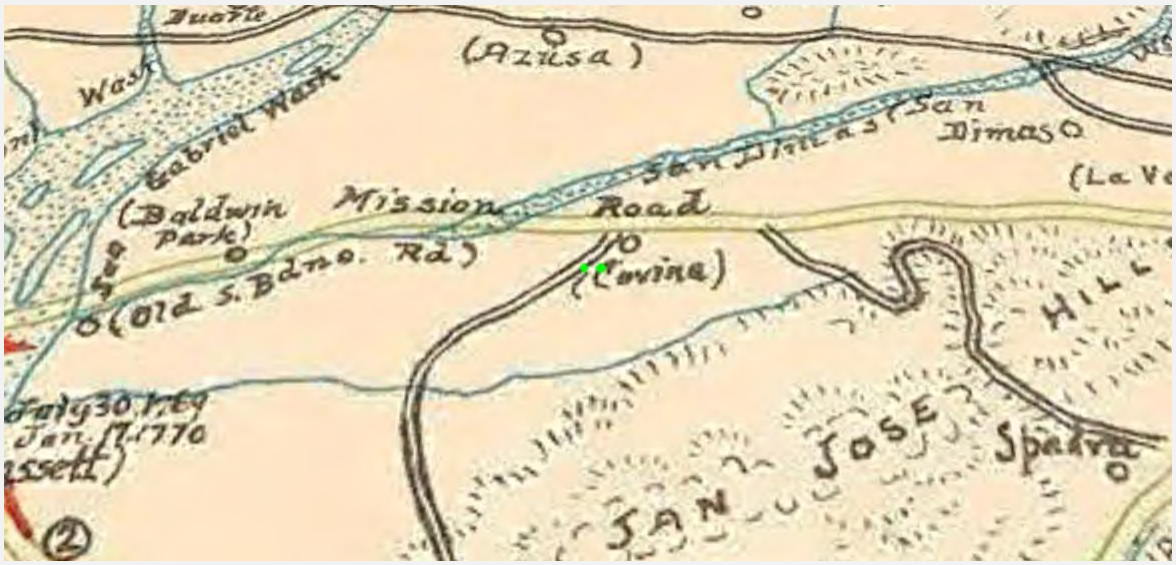
4.4 Native American Heritage Commission Sacred Lands File Search

On February 21, 2025, Dudek requested a search of the Native American Heritage Commissions (NAHC) Sacred Lands File (SLF). The SLF consists of a database of known Native American resources. These resources may not be included in the SCCIC database. The NAHC emailed a response letter on March 7, 2025. The NAHC SLF record search results were negative. The NAHC additionally provided a list of 15 Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area. To date, Dudek has not initiated contact with the individuals on the NAHC's contact list regarding the Project. Documentation of the search and correspondence with the NAHC is provided in Appendix B.

4.5 1938 Kirkman-Harriman Historical Map Review

Dudek reviewed pertinent academic and ethnographic literature for information pertaining to past Native American use of the Project site and vicinity. This review included consideration of sources commonly identified during tribal consultation, notably the 1938 Kirkman-Harriman Historical Map (Exhibit 1). Based on this map, there is an unnamed, northeast-southwest trending road directly west of the Project site and a portion of the east-west trending Old San Bernardino Road/Mission Road was located approximately 0.45 miles north of the Project site. The Project site is mapped northwest of the San Jose Hills. The nearest waterway to the Project site is the "San Dimas", mapped approximately 0.80 miles miles to the northwest.

Exhibit 1. Excerpt of the 1938 Kirkman Herriman Map depicting the Project area



Source: Compiled by Geo. W. Kirkman, C.E.B.S. August 1937, Los Angeles, California. Copyright 1938 by George W. Kirkman

While the Kirkman-Harriman Historical Map is a valuable representation of post-mission history, it should be noted that this map is highly generalized due to scale and age and may be inaccurate with regard to distance and location of mapped features. Additionally, this map was prepared based on review of historic documents and notes more than 100 years following secularization of the missions (in 1833). Although the map contains no specific primary references, it matches with the details documented by the Portola expedition (circa 1769-1770).

5 Survey

5.1 Methods

A pedestrian survey of the Project site was conducted by a qualified archaeologist on March 14, 2025, as part of this cultural evaluation All survey work was conducted using standard archaeological procedures and techniques consistent with the Secretary of the Interior's Qualifications Standards for archaeology. Where visible, the ground surface was examined for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools,

ceramics, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of the current or former presence of structures or buildings (e.g., standing exterior walls, post holes, foundations), and historic artifacts (e.g., metal, glass, ceramics, building materials).

All fieldwork was documented using field notes and iPad technology with close-scale field maps, and aerial photographs. Location-specific photographs were taken using an Apple 11th Generation iPad equipped with 8 mega-pixel (MP) resolution and georeferenced PDF maps of the Project area. All field notes, photographs, and records related to the current study are on file at Dudek's Pasadena, California office.

5.2 Results

The Project site consists of two separate sites, the Western site (APNs 8429-008-028 and -029) and the Eastern site (APN's 8429-007-005, -006, and -007). The survey results for the two sites are discussed below.

Western Project Site: This portion of the Project site is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses. The property consists of two separate, equal size buildings on the eastern and western portions of the site with a parking lot in the middle. The western site is bounded by East Edna Place to the north, the SCE Cortez Substation to the east, industrial development to the west, and the railroad alignment to the south. No exposed soil was present for observation at this location and no archaeological resources were observed.

Eastern Project Site: This portion of the Project site is currently being used as a storage facility for RVs, boats and other vehicles. The surface area is completely paved with no exposed soil for observation. The site is fenced with a chain link fence and the western portion has a concrete wall that separates it from the adjacent property. The eastern site is bordered by East Edna Place to the north, commercial and industrial development to the east and west, and the railroad alignment to the south. No archaeological resources were observed.

SCE Cortez Substation: This off-site impact area associated with the project was visually inspected from the perimeter and areas of exposed soil along East Edna Place were inspected for cultural resources. The substation consists of one building and power infrastructure including high voltage transmission towers, lightning arrestors, switchgear, transformers, busbars, and shield wires. The area was completely graded and covered in ballast and due to previous excavations associated with the installation of infrastructure, this location exhibited a high degree of disturbance. No archaeological resources were observed.

7 Summary and Mitigation Measures

Dudek conducted a cultural resources inventory and evaluation in support of the Covina Reliability Project. Efforts included a CHRIS records search, an archival information and literature review, correspondence with the Native American Heritage Commission, a cultural resources pedestrian survey and an updated California Department of Parks and Recreation (DPR) 523 Series form for previously recorded cultural resource P-19-187085.

The SCCIC records search indicate that the Project site has not been subject to any previous archaeological investigations that would have included a records search or pedestrian survey prior to development. The SCCIC records search also indicates four previously recorded cultural resources are located within one mile of the Project site. These resources consist of a prehistoric lithic scatter (P-19-000329), two historic-era built environment resources (P-19-189466, P-19-192461) and one historic-era route (P-19-187085). One of the identified cultural resources, P-19-187085, overlaps the eastern site of the Project site. P-19-187085 known as the Mojave Road, was a federal Government supply and mail route, a wagon route, a recreational trail, and Native American trail, covering approximately 300 miles across California, and was utilized during the mid-19th century. The portion of the Mojave Road which overlaps the Project site is a California Historical Landmark. Although a segment of the historic-era route is currently mapped within the Project site, there is no potential for adverse effects to P-19-187085. A review of historical topographic maps and aerial photographs indicate that the Project site has been developed and/or paved since at 1964, possibly earlier, and prior to development the Project site was in use as an orchard. Therefore, any physical remnant of P-19-187085 which may have existed within the Project site would no longer be present.

It is also possible that the mapped location of P-19-187085 is not the exact location of the historic-era route. Generally, the Mojave Road was located in the vicinity of the Project site. Review of the 1938 Kirkman-Harriman Historical Map indicates the Old San Bernardino Road/Mission Road was located approximately 0.45 miles north of the Project site and an unnamed road was located directly west of the Project site. It is possible the Mojave Road followed the route of one of the roads depicted on the 1938 Kirkman-Harriman Historical Map and is not within the Project site.

An NAHC SLF search results were negative for Native American cultural resources within the Project site. The pedestrian survey was negative for cultural resources; however, the conditions were less than reliable as the entire Project site is developed and/or paved, and no native soils were visible.

In consideration of all these factors, the potential to encounter intact cultural deposits containing archaeological and tribal cultural resources within soils is unlikely. However, in the event that archaeological resources are exposed during construction activities involving ground disturbance, the Project would have the potential to negatively affect archeological resources, which would be a significant impact under CEQA. Implementation of mitigation measures MM-CUL-1 and MM-CUL-2 would reduce this impact to below a level of significance. Therefore, impacts to archeological resources would be less than significant with mitigation incorporated.

MM-CUL- 1 Workers Environmental Awareness Program Training.

All construction personnel and monitors who are not trained archaeologists shall be briefed regarding inadvertent discoveries prior to the start of construction activities. A basic presentation

and handout or pamphlet shall be prepared in order to ensure proper identification and treatment of inadvertent discoveries. The purpose of the Workers Environmental Awareness Program (WEAP) training is to provide specific details on the kinds of archaeological materials that may be identified during construction of the Project and explain the importance of and legal basis for the protection of significant archaeological resources. Each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor.

MM-CUL-2 Inadvertent Discovery Treatment..

In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the Project, all construction work occurring within 50 feet of the find should immediately stop and a qualified archaeologist should be notified immediately to assess the significance of the find and determine whether or not additional study is warranted. If human remains or suspected human remains are discovered, all construction work occurring within 50 feet of the find should immediately stop. Depending upon the significance of the find, the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA, additional work such as preparation of an archaeological treatment plan, testing, data recovery, or monitoring may be warranted.

In accordance with Section 7050.5 of the California Health and Safety Code, if potential human remains are found, the county coroner shall be immediately notified of the discovery. The coroner shall provide a determination within 48 hours of notification. No further excavation or disturbance of the identified material, or any area reasonably suspected to overlie additional remains, shall occur until a determination has been made regarding if the find is human in origin. If the county coroner determines that the remains are, or are believed to be, Native American, the coroner shall notify the NAHC within 24 hours. In accordance with PRC Section 5097.98, the NAHC must immediately notify those persons it believes to be the most likely descendent from the deceased Native American. The most likely descendent shall then recommend to the lead agency their preferred treatment of the remains and associated grave goods.

Project Description:

Covina Reliability Project, LLC is proposing to construct and operate the Covina Reliability Project, a Battery Energy Storage System (BESS) located within the City of Covina, California. The Project will include construction of an onsite substation, which will connect to the existing and adjacent Southern California Edison (SCE) Cortez Substation via a generation transmission (gen-tie) line. The Project will be developed on approximately 3.4 acres consisting of five parcels identified as assessor parcel numbers (APNs) 8429-008-029, 8429-008-028, 8429-007-007, 8429-007-006, and 842

Re: Covina Reliability Project, Los Angeles County

To Whom It May Concern:

As requested, a record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed based on information submitted for the above referenced project. The results were negative. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. As such, a SLF search is not a substitute for consultation with all tribes that are traditionally and culturally affiliated with a project's geographic area.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. If within two weeks of notification, a response has not been received, the Commission requests that you follow-up with a telephone call or email to ensure that the project information was received.

If you receive notification of a change of address or phone number from a tribe, please notify the NAHC so that we can assure that our lists contain current information.

In addition to engaging in tribal consultation, you should consult the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center to determine whether it has information regarding the presence of recorded archaeological sites within the project area.

If you have any questions or need additional information, please contact me at Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Andrew Green
Cultural Resources Analyst

INTENTIONALLY LEFT BLANK

***Recorded by:** Dudek ***Date:** March 2025 ☐ Continuation ☒ Update

This update applies to an approximate 300 feet segment of P-19-187085, the Mojave Road, which is documented within Assessor's Identification Numbers 8429-007-005, 8429-007-006, and 8429-007-007, with an elevation of 600 feet, located south of East Edna Place and north of the Railroad tracks, within the City of Covina, Los Angeles County, California with UTM Coordinates as follows: 11S 419043E/ 3772787N (see Location Map). The site could not be located during a pedestrian survey as the parcels are entirely paved over. Review of the 1938 Kirkman-Harriman Historical Map suggests it is possible P-19-187085, the Mojave Road, could be located further to the north.

Re: Geotechnical Engineering Report
Covina BESS and Substation
530 & 680 E. Edna Place
Covina, California
Terracon Project No. LA245153

Dear Mr. Bhatti:

We have completed the scope of Geotechnical Engineering services for the above referenced project in general accordance with Terracon Proposal No. PLA245153 dated July 26, 2024 and Purchase Order No. 4900008246-S1-N35 dated August 9, 2024. This report presents the findings of the subsurface exploration and provides geotechnical recommendations concerning earthwork and the design and construction of pavements and foundations for the proposed Battery Energy Storage Systems (BESS) and substation facility.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,

Terracon

Sean Paroski, E.I.T.
Staff Engineer

Introduction

This report presents the results of our subsurface exploration and Geotechnical Engineering services performed for the proposed Battery Energy Storage System and substation facility to be located at 530 & 680 E. Edna Place in Covina, California. The purpose of these services was to provide information and geotechnical engineering recommendations relative to:

- Subsurface soil conditions
- Groundwater conditions
- Seismic site classification per CBC
- Site preparation and earthwork
- Foundation design and construction
- Gravel Surface Road Design and construction

The geotechnical engineering Scope of Services for this project included the advancement of test borings, electrical resistivity testing, laboratory testing, engineering analysis, and preparation of this report. The geotechnical engineering Scope of Services for our current scope of work included the following:

- One soil test boring to approximately 51.5 feet below ground surface (bgs) in the proposed substation areas
- Five soil test borings from approximately 25.5 to 26.5 feet below ground surface (bgs) in the proposed BESS areas
- Corrosion testing on soil samples obtained from one location
- Lab thermal resistivity testing on soil samples obtained from one location
- Field electrical resistivity at two locations
- Infiltration test borings at five locations from 5 to 10 feet bgs

Drawings showing the site, borings and electrical resistivity arrays are shown on the **Site Location** and **Exploration Plan**, respectively. The results of the laboratory testing performed on soil samples obtained from the site during our field exploration are included on the boring logs and/or as separate graphs in the **Exploration Results** section.

Project Description

Our initial understanding of the project was provided in our proposal and was discussed during project planning. A period of collaboration has transpired since the project was initiated, and our final understanding of the project conditions is as follows:

Item	Description
Project Description	The project consists of a proposed Battery Energy Storage System (BESS) and substation facility. The project is located in two separated parcels. The western parcel encompasses an approximate footprint of 1.32 acres and the eastern parcel encompasses an approximate footprint of 2.1 acres. The combined footprint of the project is 3.42 acres. The BESS and substation facility will encompass an approximate footprint of 3.12 and 0.3 acres, respectively. In addition, the site development includes approximately 3,120 square feet (sqft) of proposed biofiltration basins and proposed graded swales.
Proposed Foundation Structure	We assume concrete pads and pile foundation per the clients request for the proposed BESS and inverter units. We anticipate the substation will include a control room building, self-contained structures, and other substation elements to be supported on shallow spread footings, equipment slabs-on-grade/mat foundations, and/or drilled shafts.
Maximum Loads	Assumed maximum loads for the proposed development are as follows: ▪ BESS enclosure pads: 1000 to 1200 psf contact pressure ▪ BESS Axial Load: 75 kips ▪ BESS Shear Load: 5 kips ▪ Transformers: 500 – 1,000 psf contact pressure
Grading/Slopes	We assume that the field grade will follow the existing site grades with minimum grading required to bring the site to finish grade.
Pavements	We anticipate low-volume, aggregate-surfaced and native soil access roads that will have a maximum vehicle load of 10,000 lbs. and will travel over the access roads only once per week.
Infiltration Systems	Bioretention basins and swales are included in the site plan.

Terracon should be notified if any of the above information is inconsistent with the planned construction, especially the grading limits, as modifications to our recommendations may be necessary.

Site Conditions

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available geologic and topographic maps.

Item	Description
Parcel Information	The project is located at 530 and 680 E. Edna Place, Covina, California. The project site encompasses a total area of approximately 3.42 acres. The coordinates of the approximate center of the sites are (Western Parcel) 530 E. Edna Place: 34.0925°N, 117.8803°W (Eastern Parcel) 680 E. Edna Place: 34.0925°N, 117.8775°W
Existing Improvements	Based on our site visits and review of available aerial photographs, existing structures on the western parcel include two commercial warehouses with associated commercial parking and drive areas. The eastern parcel is yard parking and driveway. Adjacent and east of the western parcel is an existing SCE substation.
Current Ground Cover	The commercial parking and drive areas and yard parking and drive areas are covered with asphalt.
Existing Topography	The western parcel is generally flat with south to north elevations ranging from 594 to 597 feet. The eastern parcel is generally flat with south to north elevations ranging from 598 to 604 feet.

Geotechnical Characterization

Subsurface Conditions

We have developed a general characterization of the subsurface conditions based upon our review of the subsurface exploration, laboratory data, geologic setting and our understanding of the project. This characterization, termed GeoModel, forms the basis of our geotechnical calculations and evaluation of the site. Conditions observed at each exploration point are indicated on the individual logs. The individual logs can be found in the **Exploration Results** and the GeoModel can be found in the **Figures** attachment of this report.

As part of our analyses, we identified the following model layers within the subsurface profile. For a more detailed view of the model layer depths at each boring location, refer to the GeoModel.

Model Layer	Layer Name	Consistency/Density
--	**Surface Cover**	Asphalt Concrete (AC) pavement 2½ to 3 inches thick
1	**Upper Soils**	Low bearing capacity soils within the upper 10 feet consisting of very loose to loose silty sand and medium stiff sandy silt
2	**Lower Soils**	Competent soils consisting of medium dense to very dense sands with varying amounts of silt and gravel, and sandy silt and lean clay, stiff to very stiff.

The geotechnical characterization forms the basis of our geotechnical calculations and evaluation of site preparation and foundation options. As noted in **General Comments**, the characterization is based upon widely spaced exploration points across the site, and variations are likely.

Lab Results

Laboratory tests were conducted on selected soil samples and the test results are presented in the **Exploration Results** section and on the boring logs. Atterberg limit test results indicate that the on-site soils generally have low plasticity. Consolidation tests indicated that the sands encountered between the depths of approximately 2.5 and 7.5 feet bgs have a slight collapse potential when saturated under normal footing loads

of 2,000 psf. Direct shear testing on silty sands encountered between 2.5 and 5 feet indicate soils have an effective friction angle of approximately 23 to 30 degrees with apparent cohesion value of 240 to 510 psf. Maximum density/optimum moisture content testing conducted in accordance with ASTM 698 (Proctor) and ASTM D1557 (Modified Proctor) indicate that near surface soils tested have maximum dry densities ranging from 115.0 to 125.1 pounds per cubic feet (pcf) and optimum water contents ranging from 9.7 to 11.1 percent.

Groundwater

Groundwater was not encountered in our exploratory borings to the maximum depth of 51½ feet. According to data collected from the Los Angeles County Public Works Water Data Library for the State of California from a nearby well 3111A, located approximately 0.9 miles southwest of the site, historic groundwater elevation was recorded at depths greater than 200 feet below ground surface between June of 1973 and May of 2015.[1]

Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

Seismic Site Class

Based on the soil properties encountered at the site and as described on the exploration logs and results, it is our opinion that the Seismic Site Class is D. The 2022 California Building Code (CBC) Seismic Design Parameters have been generated using the ASCE 7 Hazard Tool. This web-based software application calculates seismic design parameters in accordance with ASCE 7-16 and 2022 CBC. The 2022 CBC requires that a site-specific ground motion study be performed in accordance with Section 11.4.8 of ASCE 7-16 for Site Class D sites with a mapped S_s value greater than or equal 0.2.

An exception to this requirement is included in Supplement 3 to ASCE 7 that states: "A ground motion hazard analysis is not required where the value of the parameter S_{M1} determined by Eq. (11.4-2) is increased by 50% for all applications of S_{M1} in this standard.

[1] Los Angeles Public Works. https://dpw.lacounty.gov/general/wells/#

The resulting value of the parameter S_{D1} determined by Eq. (11.4-4) shall be used for all applications of S_{D1} in the Standard."

Based on this exception, the spectral response accelerations presented in the following table were calculated using the site coefficients (F_a and F_v) from Tables 1613.2.3(1) and 1613.2.3(2) presented in Section 16.4.4 of the 2022 CBC.

Eastern Parcel Seismic Parameters	Value
2022 California Building Code Site Classification (CBC)[1]	D[2]
Site Latitude (°N)	34.0925
Site Longitude (°W)	117.8775
S_s Spectral Acceleration for a 0.2-Second Period	1.653
S_1 Spectral Acceleration for a 1-Second Period	0.612
F_a Site Coefficient for a 0.2-Second Period	1.0
F_v Site Coefficient for a 1-Second Period	1.7
Western Parcel Seismic Parameters	**Value**
2022 California Building Code Site Classification (CBC)[1]	D[2]
Site Latitude (°N)	34.0925
Site Longitude (°W)	117.8803
S_s Spectral Acceleration for a 0.2-Second Period	1.652
S_1 Spectral Acceleration for a 1-Second Period	0.612
F_a Site Coefficient for a 0.2-Second Period	1.0
F_v Site Coefficient for a 1-Second Period	1.7

1. Seismic site classification in general accordance with the *2022 California Building Code*.
2. The 2022 California Building Code (CBC) requires a site soil profile determination extending to a depth of 100 feet for seismic site classification. The current scope does not include the 100-foot soil profile determination. Borings were extended to a maximum depth of 51½ feet, and this seismic site class definition considers that similar or denser soils continue below the maximum depth of the subsurface exploration. Additional exploration to deeper depths would be required to confirm the conditions below the current depth of exploration.

Typically, a site-specific ground motion study may generate less conservative coefficients and acceleration values which may reduce construction costs. We recommend consulting with a structural engineer to evaluate the need for such study and its potential impact on construction costs. Terracon should be contacted if a site-specific ground motion study is desired

Faulting and Estimated Ground Motions

The site is located in southern California, which is a seismically active area. The type and magnitude of seismic hazards affecting the site are dependent on the distance to causative faults, the intensity, and the magnitude of the seismic event. As calculated using the USGS Unified Hazard Tool, the following faults are considered to have the most significant effects at the site from a design standpoint:

Fault Name	Magnitude	Distance miles (km)
Sierra Madre	7.66	4.5 (7.3)
San Jose	6.95	3.0 (4.8)
Puente Hills (Coyote Hills)	7.26	7.5 (12.0)
San Andreas (Mojave)	8.04	22.3 (35.9)
Richfield	6.25	8.7 (14.1)
Whittier alt 2	7.38	9.8 (15.7)
Raymond	7.14	8.3 (13.3)
Chino alt 2	6.80	8.5 (13.6)

Based on the USGS Design Maps Summary Report, using the American Society of Civil Engineers (ASCE 7-16) standard, the design peak ground acceleration (PGA_M) for the eastern project site is 0.771g. Based on the USGS Unified Hazard Tool, the project site seismicity for the 2% chance of exceedance in 50 years (return period of 2475 years) hazard is defined by a mean magnitude of 6.97.

Based on the USGS Design Maps Summary Report, using the American Society of Civil Engineers (ASCE 7-16) standard, the design peak ground acceleration (PGA_M) for the western project site is 0.77g. Based on the USGS Unified Hazard Tool, the project site seismicity for the 2% chance of exceedance in 50 years (return period of 2475 years) hazard is defined by a mean magnitude of 6.94.

The site is not located within an Alquist-Priolo Earthquake Fault Zone based on our review of the State Fault Hazard Maps.[2]

Liquefaction

Liquefaction is a mode of ground failure that results from the generation of high pore water pressures during earthquake ground shaking, causing loss of shear strength. Liquefaction is typically a hazard where loose sandy soils exist below groundwater. The California Geological Survey (CGS) has designated certain areas as potential liquefaction hazard zones. These are areas considered at a risk of liquefaction-related ground failure during a seismic event, based upon mapped surficial deposits and the presence of a relatively shallow water table.

The project site has not been mapped by CGS as being located within a liquefaction hazard zone. Groundwater was not encountered in our exploratory borings, and depth to groundwater has historically been greater than 200 feet. Based upon the depth to groundwater and soil properties encountered, we consider the risk of liquefaction settlement to be low.

Corrosivity

The results of laboratory sulfides, soluble sulfate, chlorides, electrical resistivity, redox potential, total salts, and pH testing are presented in our appendix within the **Exploration Results** section. The values may be used to estimate potential corrosive characteristics of the on-site soils with respect to contact with the various underground materials which will be used for project construction.

Results of soluble sulfate testing indicate the sample of the on-site soils tested possessed negligible sulfate concentrations when classified in accordance with Table 19.3.1.1 of the ACI Design Manual. Concrete should be designed in accordance with the exposure class S0 provisions of the ACI Design Manual, Section 318, Chapter 19.

For protection against corrosion to buried metals, Terracon recommends that an experienced corrosion engineer be consulted to evaluate the need for further measures and to design a suitable corrosion protection system for underground metal structures or components. If corrosion of buried metal is critical, it should be protected using a non-

[2] California Geological Survey. https://maps.conservation.ca.gov/cgs/informationwarehouse.

corrosive backfill, wrapping, coating, sacrificial anodes, or a combination of these methods, as designed by a qualified corrosion engineer.

Electrical Resistivity Testing

Terracon performed field measurements of soil electrical resistivity for the support of grounding design. Soil resistivity data was obtained from two test arrays at two locations in the proposed project site. The approximate locations of the tests are shown in the **Exploration Plan**. The testing was performed in general accordance with Wenner Array (4-pin) method per ASTM G57. This method was performed in with IEEE Standard 81, IEEE Guide for Measuring Earth Resistivity, Ground Impedance and Earth Surface Potentials of a Ground System. The test in the proposed locations included perpendicular arrays, North-South and East-West, with "a" spacings 2, 4, 6, 8, 12, 20, 30, 50, and 70 feet. The North-South spacings reached a maximum length of 70 feet while the East-West spacings reached a maximum length of 20 and 70 feet, for the substation and BESS tests, respectively. Spacings up to 80 feet were proposed for the substation and BESS areas. However, these spacings were omitted due to site constraints including the site's length and allowable access area. The "a" spacing is generally considered to be the depth of influence of the test. The electrical resistivity test results are presented in **Exploration Results**.

Thermal Resistivity Testing

Terracon subcontracted Geotherm USA to perform laboratory thermal resistivity testing. Testing was conducted on two (2) bulk samples at the project site from a depth of 1 to 5 feet bgs within the proposed BESS and substation area each. The tests were conducted on soil samples remolded to 90% (as determined by ASTM D1557) of the material's maximum dry density for a total of two tests. Dry out curves targeted the higher of either the in-situ moisture content of the optimum moisture content as determined by ASTM D1557, totally dry condition, and two intermediate points.

In accordance with our scope of work, bulk samples were shipped to Geotherm to perform thermal resistivity testing. The results of testing have not been completed at the time of preparation of this report and will be provided in the final report.

Stormwater Management

Two shallow in-situ infiltration tests (falling head borehole permeability) were performed at approximate depths of 5 and 10 feet bgs within boreholes drilled with an 8-inch diameter auger. The objective of the testing is to provide infiltration rates of in situ soils for designing the proposed infiltration system. A 2-inch thick, ¾-inch gravel layer was placed in the bottom of each boring after the borings were drilled to investigate the soil

profile. A three-inch diameter perforated pipe was installed on top of the gravel layer and gravel was used to backfill between the perforated pipes and the boring sidewall. The borings were then filled with water for a pre-soak period.

At the beginning of each test, the pipes were refilled with water and readings were taken at periodic time intervals as the water level dropped. The soil at the percolation test locations was classified in the field using a visual/manual procedure. The infiltration velocity is presented as the infiltration rate and is summarized in the following table. The infiltration rates provided do not include safety factors.

Test Location	Boring Depth (ft.)[1]	Test Depth Range (ft.) [1]	Soil Type	Percolation Rate Average (in./hr.)	Infiltration Rate Average (in./hr.) [2]
P-1	5	0 to 5	SM	88.0	8.4
P-2	10	5 to 10	SP-SM	96.0	9.6
P-3	5	0 to 5	SM	84.0	7.8
P-4	5	0 to 5	SM	42.3	3.4
P-5	10	5 to 10	ML	43.3	3.3

1. Below existing ground surface.
2. If proposed infiltration system will mainly rely on vertical downward seepage, the correlated infiltration rates should be used. Correlation was based on the County of Los Angeles method.

The subsurface materials encountered in our borings are characterized by clayey soils within the upper 5 to 10 feet, underlain by interbedded layers of silty and clayey sand with lower fines content. It is our opinion that that the infiltration test conducted at boring P-2 was draining into these highly permeable soils with low fine grained soil content, accounting for the higher measured infiltration rate. If the proposed infiltration system will be designed using these higher rates, it should be accounted for in the system's designed depth to reach these highly permeable soils.

The field test results are not intended to be design rates. They represent the result of our tests, at the depths and locations indicated, as described above. The design rate should be determined by the designer by applying an appropriate factor of safety. Based on the County of Los Angeles Department of Public Works GS200.1 document, the following reduction factors are recommended:

LA County Reduction Factor	Value
RF_t	2
RF_v	1
RF_s	2[1]
RF, Total Reduction Factor $RF=RF_t + RF_v + RF_s$	5

1. This factor 1 may be used if stormwater will be clear and filtered of silts and sediments prior to infiltration. We recommend the designer confirm this Reduction Factor

Infiltration rates can be affected by silt buildup, debris, degree of soil saturation, site variability and other factors. The rate obtained at specific location and depth is representative of the location and depth tested and may not be representative of the entire site. Application of an appropriate safety factor is prudent to account for subsoil inconsistencies, possible compaction related to site grading, and potential silting of the percolating soils, depending on the application.

With time, the bottoms of infiltration systems tend to plug with organics, sediments, and other debris. Long term maintenance will likely be required to remove these deleterious materials to help reduce decreases in actual percolation rates.

The design engineer should also check with the local agency for the limitation of the infiltration rate allowed in the design. If the maximum allowable design infiltration rate is lower than the above recommended rate, the maximum allowable design infiltration rate should be used. The designer of the basins should also consider other possible site variability in the design.

The percolation tests were performed with clear water, whereas the storm water will likely not be clear, but may contain organics, fines, and grease/oil. The presence of these deleterious materials will tend to decrease the rate that water percolates from the infiltration systems. Design of the storm water infiltration systems should account for the presence of these materials and should incorporate structures/devices to remove these deleterious materials.

Based on the soils encountered in our borings, we expect the percolation rates of the soils could be different than measured in the field due to variations in fines and gravel content. The design elevation and size of the proposed infiltration system should account for this expected variability in infiltration rates.

Infiltration testing should be performed after construction of the infiltration system to verify the design infiltration rates. It should be noted that siltation and vegetation growth along with other factors may affect the infiltration rates of the infiltration areas. The actual infiltration rate may vary from the values reported here. Infiltration systems should be located at least 10 feet from any existing or proposed foundation system.

Geotechnical Overview

The site appears suitable for the proposed construction based upon geotechnical conditions encountered in the test borings, provided that the recommendations provided in this report are implemented in the design and construction phases of this project.

We anticipate that the proposed BESS structures will be supported on short driven steel piles. Substation pads will be supported by a shallow foundation system bearing on engineered fill, or mat foundations and other appurtenant electrical equipment will be supported on drilled shaft foundations.

Based on the findings summarized in this report, it is our professional opinion that the proposed construction will not be subjected to a hazard from settlement, slippage, or landslide, provided the recommendations of our report are incorporated into the proposed construction. It is also our opinion that the proposed construction will not adversely affect the geologic stability of the site or adjacent properties provided the recommendations contained in our report are incorporated into the proposed construction.

Geotechnical engineering recommendations for foundation systems and other earth connected phases of the project are outlined below. The recommendations contained in this report are based upon the results of field and laboratory testing (presented in the **Exploration Results**), engineering analyses, and our current understanding of the proposed project. The **General Comments** section provides an understanding of the report limitations.

Earthwork

The following presents recommendations for site preparation, excavation, subgrade preparation, and placement of engineered fills on the project. The recommendations presented for the design and construction of foundations are contingent upon following the recommendations outlined in this section.

Earthwork on the project should be observed and evaluated by Terracon. The evaluation of earthwork should include observation and testing of engineered fill, subgrade

preparation, foundation of bearing soils, and other geotechnical conditions exposed during construction of the project.

An on-site, pre-job meeting with the owner, the contractor and the Geotechnical Engineer should occur prior to all grading-related operations. Observation, testing, documentation, and reporting of the grading operation should be performed by the Geotechnical Engineer of Record. A final compaction report should be issued by the Geotechnical Engineer of Record at the completion of the grading operation. Interim reports may be issued according to project requirements. Operations undertaken at the site without the Geotechnical Engineer present may result in exclusions of affected areas from compaction reports for the project.

Grading of the subject site should be performed, at a minimum, in accordance with these recommendations and with applicable portions of the current version of CBC. The following recommendations are presented for your assistance in establishing proper grading criteria.

Site Preparation

Prior to placing fill, existing pavement, debris, and other deleterious materials should be removed from proposed foundation and roadway areas. Exposed surfaces within these areas should be free of mounds and depressions which could prevent uniform compaction. The site should be initially graded to create a relatively level surface to receive fill and provide for a relatively uniform thickness of fill beneath proposed structures.

Demolition of the existing buildings should include complete removal of all foundation systems and remaining underground utilities within the proposed construction area. This should include removal of any loose backfill found adjacent to existing foundations. All materials derived from the demolition of existing structures and pavements should be removed from the site and not be allowed for use as on-site fill, unless processed in accordance with the fill requirements included in this report.

In the event the contractor desires to crush on-site pavements and concrete and use these materials as engineered fill, the crushed materials should be evaluated and tested for compliance with the requirements and specifications of the State of California Department of Transportation, or other approved local governing specifications.

Although no evidence of fills or underground facilities such as septic tanks, cesspools, or basements was observed during the site reconnaissance, such features could be encountered during construction. If unexpected fills, utilities, or underground facilities are encountered, such features should be removed, and the excavation thoroughly cleaned prior to backfill placement and/or construction.

Subgrade Preparation

Due to the anticipated disturbance of near surface soils during the demolition of existing structures and grading, shallow foundations bearing on engineered fill are recommended for support of the proposed BESS/substation equipment pads.

Engineered fill should extend to a minimum depth of 2 feet below the bottom of foundations, to the depth of disturbed zone associated with demolition of the existing building, or 4 feet below existing grades, whichever is greater. Grading for the proposed BESS/substation should incorporate the limits of the overexcavation plus a lateral distance of 2 feet beyond the outside edge of perimeter footings. Beyond site preparation and removal of disturbed soils associated with the demolition of the existing building, overexcavation and replacement is not required for support of drilled shaft foundations or driven piles.

Subgrade soils beneath proposed exterior slabs and gravel access roads should be scarified to a minimum depth of 10 inches, moisture conditioned, and compacted. The moisture content and compaction of subgrade soils should be maintained until slab or pavement construction.

All exposed areas which will receive fill, once properly cleared and benched where necessary, should be scarified to a minimum depth of 10 inches, moisture conditioned as necessary, and compacted per the compaction requirements in this report. Compacted structural fill soils should then be placed to the proposed design grade and the moisture content and compaction of subgrade soils should be maintained until foundation or pavement construction.

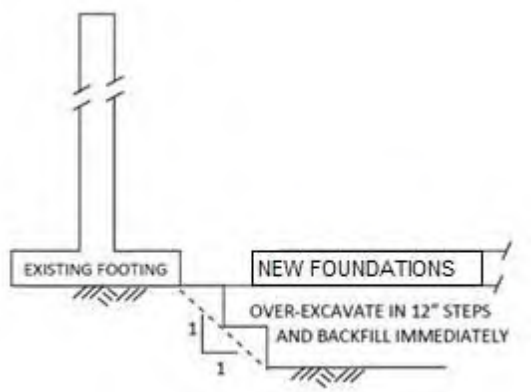
Based upon the subsurface conditions determined from the geotechnical exploration, subgrade soils exposed during construction are anticipated to be relatively workable; however, the workability of the subgrade may be affected by precipitation, repetitive construction traffic or other factors. If unworkable conditions develop, workability may be improved by scarifying and drying.

Excavation

We anticipate that excavations for the proposed construction can be accomplished with conventional earthmoving equipment.

The bottom of excavations should be thoroughly cleaned of loose soils and disturbed materials prior to backfill placement and/or construction.

If new foundations are constructed near existing foundations, there is a risk that the bearing material could become undermined and/or overstressed due to overlapping stresses. Provisions should be made during construction to prevent undermining or disturbing the soils supporting the existing foundations. Excavations should not extend below an imaginary 1H:1V inclined plane projecting below the bottom edge of any adjacent existing foundations as shown in the figure to the right.



Maintaining a sufficient clear distance between new and existing foundations will reduce the potential for increased bearing stresses and additional foundation settlement. Connections between the existing building and the new addition should allow for some differential movement. Individual contractors are responsible for designing and constructing stable, temporary excavations. Excavations should be sloped or shored in the interest of safety following local, and federal regulations, including current OSHA excavation and trench safety standards.

Onsite soils consist of cohesionless sandy soils. Such soils have the tendency to cave and slough during excavations. Therefore, formwork may be needed for foundation excavations.

Fill Material and Placement

All fill materials should be inorganic soils free of vegetation, debris, and fragments larger than six inches in size. Pea gravel or other open-graded materials should not be used as fill or backfill without the prior approval of the geotechnical engineer.

Clean on-site soils (Provided they are screened for oversized particles with dimensions larger than 3 inches) or approved imported materials may be used as fill material for the following:

- general site grading
- foundation areas
- interior floor slab areas
- foundation backfill
- gravel access roads
- exterior slab areas

Imported soils for use as fill material within proposed structure areas should conform to low volume change materials as indicated in the following specifications:

Gradation	Percent Finer by Weight (ASTM C 136)
3"	100
No. 4 Sieve	50-100
No. 200 Sieve	40(max)

- Liquid Limit ..... 30 (max)
- Plasticity Index ..... 10 (max)
- Maximum Expansion Index* ..... 20 (max)

*ASTM D4829

The contractor shall notify the Geotechnical Engineer of import sources sufficiently ahead of their use so that the sources can be observed and approved as to the physical characteristic of the import material. For all import material, the contractor shall also submit current verified reports from a recognized analytical laboratory indicating that the import has a "not applicable" (Class S0) potential for sulfate attack based upon current ACI criteria and is "mildly corrosive" to ferrous metal and copper. The reports shall be accompanied by a written statement from the contractor that the laboratory test results are representative of all import material that will be brought to the job.

Engineered fill should be placed and compacted in horizontal lifts, using equipment and procedures that will produce recommended moisture contents and densities throughout the lift. Fill lifts should not exceed 10 inches loose thickness.

Compaction Requirements

Recommended compaction and moisture content criteria for engineered fill materials are as follows:

Material Type and Location	Per the Modified Proctor Test (ASTM D 1557)		
	Minimum Compaction Requirement	Range of Moisture Contents for Compaction Above Optimum	
		Minimum	Maximum
Approved on-site or imported fill soils:			
Beneath shallow foundations:	90%	0%	+4%
Beneath gravel access roads:	95%	0%	+4%

Material Type and Location	Per the Modified Proctor Test (ASTM D 1557)		
	Minimum Compaction Requirement	Range of Moisture Contents for Compaction Above Optimum	
		Minimum	Maximum
Utility trenches[1]:	95%	0%	+4%
Exterior Slabs:	90%	0%	+4%
Miscellaneous backfill:	90%	0%	+4%

1. Upper 12 inches should be compacted to 95% within pavement and structural areas. Low-volume change imported soils should be used in lightly loaded equipment areas.

Utility Trench Backfill

We anticipate that the on-site soils will provide suitable support for underground utilities and piping that may be installed. Any soft and/or unsuitable material encountered at the bottom of excavations should be removed and be replaced with an adequate bedding material.

Trench excavation should not be conducted below a downward 1:1 projection from existing foundations without engineering review of shoring requirements and geotechnical observation during construction.

A non-expansive granular material with a sand equivalent greater than 30 should be used for bedding and shading of utilities, unless allowed or specified otherwise by the utility manufacturer.

On-site materials are considered suitable for backfill of utility and pipe trenches from 1 foot above the top of the pipe to the final ground surface, provided the material is free of organic matter and deleterious substances.

Trench backfill should be mechanically placed and compacted as discussed earlier in this report. Compaction of initial lifts should be accomplished with hand-operated tampers or other lightweight compactors. Where trenches are placed beneath footings, the backfill should satisfy the gradation and expansion index requirements of engineered fill discussed in this report. Flooding or jetting for placement and compaction of backfill is not recommended.

Grading and Drainage

All grades must provide effective drainage away from the proposed structure during and after construction and should be maintained throughout the life of the structure. Water

retained next to the structures result in soil movements greater than those discussed in this report. Greater movements can result in unacceptable differential foundation movements, cracked slabs and walls, and roof leaks.

Backfill against footings and in utility and sprinkler line trenches should be well compacted and structure of all construction debris to reduce the possibility of moisture infiltration.

We recommend a minimum horizontal setback distance of 10 feet from the perimeter of any structure and the high-water elevation of the nearest storm-water retention basin.

Roof drainage should discharge into splash blocks or extensions when the ground surface beneath such features is not protected by exterior slabs or paving. Sprinkler systems and landscaped irrigation should not be installed within 5 feet of foundation walls.

Exterior Slab Design and Construction

Exterior slabs-on-grade, exterior architectural features, and utilities founded on, or in backfill may experience some movement due to the volume change of the backfill. To reduce the potential for damage caused by movement, we recommend:

- minimizing moisture increases in the backfill;
- controlling moisture-density during placement of backfill;
- using designs which allow vertical movement between the exterior features and adjoining structural elements;
- placing effective control joints on relatively close centers.

Earthwork Construction Considerations

Upon completion of filling and grading, care should be taken to maintain the subgrade water content prior to construction of roadways. Construction traffic over the completed subgrades should be avoided to the extent practical. The site should also be graded to prevent ponding of surface water on the prepared subgrades or in excavations. Water collecting over or adjacent to construction areas should be removed. If the subgrade desiccates, saturates, or is disturbed, the affected material should be removed, or the materials should be scarified, moisture conditioned, and recompacted prior to roadway construction.

Construction site safety is the sole responsibility of the contractor who controls the means, methods, and sequencing of construction operations. Under no circumstances shall the information provided herein be interpreted to mean Terracon is assuming responsibility for construction site safety, or the contractor's activities; such responsibility shall neither be implied nor inferred.

We recommend that the earthwork portion of this project be completed during extended periods of dry weather if possible. If earthwork is completed during the wet season (typically November through April) it may be necessary to take extra precautionary measures to protect subgrade soils. Wet season earthwork operations may require additional mitigative measures beyond that which would be expected during the drier summer and fall months. This could include diversion of surface runoff around exposed soils and draining of ponded water on the site. Once subgrades are established, it may be necessary to protect the exposed subgrade soils from construction traffic.

The individual contractor(s) is responsible for designing and constructing stable, temporary excavations as required to maintain stability of both the excavation sides and bottom. Excavations should be sloped or shored in the interest of safety following local, and federal regulations, including current Occupational Safety and Health Administration (OSHA) excavation and trench safety standards.

Construction Observation and Testing

The geotechnical engineer should be retained during the construction phase of the project to observe earthwork and to perform necessary tests and observations during subgrade preparation, proof-rolling, placement and compaction of controlled compacted fills, backfilling of excavations to the completed subgrade.

The exposed subgrade and each lift of compacted fill should be tested, evaluated, and reworked, as necessary, as recommended by the Geotechnical Engineer prior to placement of additional lifts. Each lift of fill should be tested for density and water content at a frequency of at least one test for every 2,500 square feet of compacted fill in the building areas and 5,000 square feet in pavement areas. Where not specified by local ordinance, one density and water content test should be performed for every 50 linear feet of compacted utility trench backfill. This testing frequency criteria may be adjusted during construction as specified by the geotechnical engineer of record.

In areas of foundation excavations, the bearing subgrade should be evaluated by the Geotechnical Engineer. If unanticipated conditions are observed, the Geotechnical Engineer should prescribe mitigation options.

In addition to the documentation of the essential parameters necessary for construction, the continuation of the Geotechnical Engineer into the construction phase of the project provides the continuity to maintain the Geotechnical Engineer’s evaluation of subsurface conditions, including assessing variations and associated design changes.

Shallow Foundations

We anticipate that the proposed BESS/substation equipment will be supported on either spread footings, mat foundation or drilled shafts.

Recommendations for foundation for the proposed structures and related structural elements are presented in the following paragraphs.

If the site has been prepared in accordance with the requirements noted in **Earthwork**, the following design parameters are applicable for shallow foundations.

Shallow Foundation Design Recommendations

Item	Description
Foundation System	Spread footings, mat foundation
Maximum Net Allowable Bearing Pressure (for a total static settlement of 1 inch)[1, 2]	3,000 psf 2 to 5 feet wide 1,500 psf up to 10 feet wide 1,000 psf up to 20 feet wide
Maximum Net Allowable Bearing Pressure (for a total static settlement of 2 inch)[1, 2]	4,000 psf 2 to 5 feet wide 6,000 psf up to 10 feet wide 3,000 psf up to 20 feet wide
Required Bearing Stratum [3]	Engineered fill extending to a minimum of 2 feet below the bottom of foundations, or 4 feet below existing grade, or the depth of undocumented fill/disturbed soils associated with demolition of the existing building, whichever is greater.
Design Modulus of Subgrade Reaction, k[3]	175 pounds per square inch per inch (psi/in) The modulus was obtained on estimates obtained from NAVFAC 7.1 design charts. This value is for a small-loaded area (1 sq.ft. or less) such as for forklift wheel loads or point loads and should be adjusted for larger loaded areas.
Modulus Correction Factor[3]	$k_s = \left(B + 1/2B\right)^2$
Minimum Embedment Below Finished Grade	12 inches
Minimum Dimensions	Square footings and mats: 24 inches Strip footings: 18 inches
Estimated Total Settlement from Structural Loads	About 1 inch

Item	Description
Estimated Differential Settlement	About 1/2 of total settlement over a horizontal distance of 40 feet

1. The maximum net allowable bearing pressure is the pressure in excess of the minimum surrounding overburden pressure at the footing base elevation. An appropriate factor of safety has been applied. These bearing pressures can be increased by 1/3 for transient loads unless those loads have been factored to account for transient conditions.
2. **Maximum allowable pressure is based on both calculated bearing capacities and allowable settlements**.
3. k values should be reduced to account for dimensional effects of largely loaded areas. Where kc is the corrected or design modulus value and B is the mat width in feet.

Settlement calculations were performed utilizing Westergaard and Hough's methods[3] to estimate the static settlement for various foundations widths with allowable settlements of 1 to 2 inches.

Finished grade is defined as the lowest adjacent grade within five feet of the foundation for perimeter (or exterior) footings.

The allowable foundation bearing pressure applies to dead loads plus design live load conditions. The design bearing pressure may be increased by one-third when considering total loads that include wind or seismic conditions. The weight of foundation concrete below grade may be neglected in dead load computations.

Foundation should be reinforced as necessary to reduce the potential for distress caused by differential foundation movement. Foundation excavations should be observed by the geotechnical engineer. If the soil conditions encountered differ significantly from those presented in this report, supplemental recommendation will be required.

[3] *FHWA Geotechnical Engineering Circular No. 6 – Shallow Foundations, FHWA – SA-02-054*

Lateral Earth Pressures

Design Parameters

For engineered fill comprised of on-site soils or imported low volume change materials above any free water surface, recommended equivalent fluid pressure of unrestrained foundation elements are:

Item	Recommended Value
Active Case	38 psf/ft
Passive Case	400 psf/ft
At-Rest Case	58 psf/ft
Ultimate Coefficient of Sliding Friction	0.39

1. The values are based on engineered fill materials used as backfill.
2. Uniform, horizontal backfill, compacted to at least 90% of the ASTM D 1557 maximum dry density, rendering a maximum
3. Use of passive earth pressures require the sides of the excavation for the foundation to be nearly vertical and the concrete placed neat against these vertical faces or that the foundation forms be removed and compacted engineered fill be placed against the vertical foundation face
4. Can be used to compute sliding resistance where foundations are placed on suitable soil/materials. Should be neglected for foundations subject to net uplift conditions.
5. Passive pressure and sliding friction may be combined to resist sliding provided that either the passive pressure or frictional resistance (adhesion) is reduced by 50 percent.

The lateral earth pressures herein do not include any factor of safety and are not applicable for submerged soils/hydrostatic loading. Additional recommendations may be necessary if such conditions are to be included in the design.

Fill against foundation walls should be compacted to densities specified in the Earthwork section of this report. Compaction of each lift adjacent to walls should be accomplished with hand-operated tampers of other lightweight compactors.

Deep Foundations

Driven Pile Design Parameters

Proposed battery storage units can be supported on driven steel W-section foundations (assumed to be W6x9 or similar) in general accordance with the following sections.

The design capacity of a single-driven pile is a function of several factors including:

- Size and type of pile;
- Type and capacity of pile installation equipment;
- Pile integrity after installation; and
- Engineering properties of the subsurface soils.

Based on specific conditions encountered on site, the soils are generally considered drivable for pile installation. The most effective means of verifying pile drivability and capacities for either tension or lateral loads is through pile load tests. Pile foundation design parameters have been based upon correlated capacities utilizing soil strength criteria determined from the soil borings and laboratory testing.

The tables below neglect a depth of 1 foot for axial and lateral resistance. This neglect is estimated based on our experience and accounts for depth of scour and/or disturbance from utilities near the piles. Depth of neglect should be verified and adjusted by the design engineer based on the scour analysis. Allowable capacities were based on a minimum factor-of-safety (FOS) of 2.0 for skin friction and 3.0 for end bearing.

Stratigraphy[1]		γ′ (pcf)	Allowable Compression Unit Skin friction (psf)[1]	Allowable Bearing Pressure (psf)[2]
Layer	Depth Below Finished Grade (feet)			
1	1	105	45	2,800
	5			
2	5	105	115	3,500
	10			
3	10	110	220	10,800
	20			

1. Allowable uplift capacity is on the order of 60% of the compression capacity values in the table. The values provided should be multiplied by the box perimeter of the pile times the depth. The box perimeter is considered two times the width of the flange plus two times the depth of the web.
2. The values provided should be multiplied by the box area of the pile and be used for compression resistance only.

Recommended soil parameters for lateral load analysis of driven pile foundations have been developed for use in LPILE computer programs. Engineering properties have been estimated as outlined below:

Description	Top Depth Bottom Depth	Effective Unit Weight (pcf)	L-PILE/ GROUP Soil Type	ϕ (°)
Stratum 1	1	105	Sand	29
	10			

Description	Top Depth Bottom Depth	Effective Unit Weight (pcf)	L-PILE/ GROUP Soil Type	ϕ (°)
Stratum 2	10 20	110	Sand	35

Driven Piles Construction Considerations

Based on the field exploration and laboratory testing, it is our opinion that the soils on the site are suitable for pile installation into native soils.

A geotechnical engineer should be engaged to make periodic observations of pile driving operations during construction. Each pile should be observed and checked for buckling, crimping and alignment in addition to recording penetration resistance, depth of embedment, and general pile driving operations.

As part of the overall quality control program, the time rate of installation (seconds per foot of embedment) should be recorded during production post driving. As a direct extension of the design process, additional "proof" testing should be performed on a representative number of production posts that do not meet the minimum installation rate criteria outlined in this report.

Drilled Shaft Design Recommendations

Proposed substation structures may be supported on drilled shafts. Total required embedment of the drilled shaft should be determined by the structural engineer based on structural loading and parameters provided in this report.

Drilled Shaft Axial Loading

Allowable skin friction and total capacity charts are attached to our **Supporting Information** section at the end of this report. The values presented for allowable side friction and end bearing include a factor of safety of 2.5.

Drilled piers should have a minimum (center-to-center) spacing of three diameters. Closer spacing may require a reduction in axial load capacity. Axial capacity reduction can be determined by comparing the allowable axial capacity determined from the sum of individual piers in a group versus the capacity calculated using the perimeter and base of the pier group acting as a unit. The lesser of the two capacities should be used in design.

The allowable uplift capacities should only be based on 60% of the side friction of the shaft; however, the weight of the foundation should be added to these values to obtain the actual allowable uplift capacities for drilled shafts. Tensile reinforcement should extend to the bottom of shafts subjected to uplift loading.

Drilled Shaft Lateral Loading

Based on our review of the subsurface conditions in the area of the BESS/substation, our laboratory testing, and the Standard Penetration Test (SPT) results, engineering properties have been estimated for the soils conditions as shown in the following table. Due to potential for disturbance within the upper 2 feet should be neglected.

Recommended geotechnical parameters for lateral load analyses by others of drilled shaft foundations have been developed for use in the LPILE computer program. The following table summarizes input values for use in LPILE analyses. LPILE estimated values of k_h and $\mathcal{E}50$ may be used. Since deflection or a service limit criterion will most likely control lateral capacity design, no safety/resistance factor is included with the parameters.

Stratigraphy[1]		L-Pile Soil Model	ϕ[2]	Cohesion (psf)	γ' (pcf)[2]
Layer	Depth Below Finished Grade (feet)				
1	2	Sand	29	--	105
	10				
2	10	Sand	35	--	110
	20				
3	20	Stiff Clay w/o Water	--	2,000	110
	30				
4	30	Sand	42	--	115
	40				
5	40	Sand	32	--	115
	50				

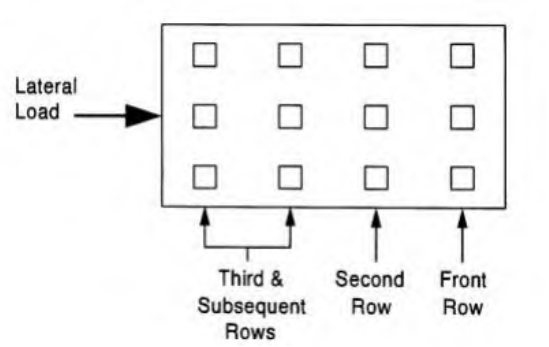
1. See Subsurface Profile in **Geotechnical Characterization** for more details on Stratigraphy.
2. Definition of Terms:
   ϕ: Internal friction angle

Stratigraphy[1]		L-Pile Soil Model	ϕ[2]	Cohesion (psf)	γ' (pcf)[2]
Layer	Depth Below Finished Grade (feet)				

γ': Effective unit weight

The load capacities provided herein are based on the stresses induced in the supporting soil strata. The structural capacity of the shafts/piles should be checked to assure they can safely accommodate the combined stresses induced by axial and lateral forces. Lateral deflections of shafts/piles should be evaluated using an appropriate analysis method, and will depend upon the pile's diameter, length, configuration, stiffness and "fixed head" or "free head" condition. We can provide additional analyses and estimates of lateral deflections for specific loading conditions upon request. The load-carrying capacity of shafts/piles may be increased by increasing the diameter and/or length.

When piers are used in groups, the lateral capacities of the piers in the second, third, and subsequent rows of the group should be reduced as compared to the capacity of a single, independent pier. Guidance for applying p-multiplier factors to the p values in the p-y curves for each row of pier foundations within a pier group are as follows:



1. Front row: Pm = 0.8
2. Second row: Pm = 0.4
3. Third and subsequent row: Pm= 0.3

For the case of a single row of piers supporting a laterally loaded grade beam, group action for lateral resistance of piers would need to be considered when spacing is less than five pier diameters (measured center-to-center). However, spacing closer than 3D (where D is the diameter of the pier) is not recommended due to the potential for the installation of a new pier disturbing an adjacent installed pier, likely resulting in axial capacity reduction.

Drilled Shaft Construction Considerations

Drilling to design depths should be possible with conventional single flight power augers. For drilled shaft depths above the depth of groundwater, temporary steel casing will likely be required to properly drill and clean shafts prior to concrete placement. Drilled pier bearing surfaces must be thoroughly cleaned and all loose materials removed from the bottom of the pier excavation prior to concrete placement.

We do not anticipate drilled shafts to extend below the depth of groundwater. However, if foundation concrete cannot be placed in dry conditions, a tremie should be used for concrete placement.

Drilled shaft foundation concrete should be placed immediately after completion of drilling and cleaning. Due to potential sloughing and raveling, foundation concrete quantities may exceed calculated geometric volumes.

In the event drilled hole walls slough during drilling, temporary steel casing may be required to properly drilled shafts prior to concrete placement. We recommend the use of slurry drilling methods with polymers method to keep the solids in suspension during the drilling. Drilled shaft foundation concrete should be placed within 6 inches of the shaft base of the slurry-filled excavation immediately after completion of drilling and cleaning. The tremie should remain inserted several feet into the fresh concrete as it displaces the slurry upward and until placement is complete. The slurry should have a sand content no greater than 1% at the time concrete placement commences. The maximum unit weight of the slurry should be established in consultation with Terracon.

If casing is used for drilled shaft construction, it should be withdrawn in a slow continuous manner maintaining a sufficient head of concrete to prevent infiltration of water or the creation of voids in shaft concrete. Shaft concrete should have a relatively high fluidity when placed in cased shaft holes or through a tremie. Shaft concrete with slump in the range of 6 to 8 inches is recommended.

Foundation concrete should be placed immediately after completion of drilling and cleaning. Closely spaced shafts should be drilled and filled alternatively, allowing the concrete to set at least eight hours before drilling the adjacent shaft. All excavations should be filled with concrete as soon after drilling as possible. In no event should shaft holes be left open overnight.

Formation of mushrooms or enlargements at the tops of shafts should be avoided during shaft drilling. If mushrooms develop at the tops of the shafts during drilling, sono-tubes should be placed at the shaft tops to help isolate the shafts.

Free-fall concrete placement in drilled piers will only be acceptable if provisions are taken to avoid striking the concrete on the sides of the hole or reinforcing steel. The use

of a bottom-dump hopper, or an "elephant's trunk" discharging near the bottom of the hole where concrete segregation will be minimized, is recommended.

We recommend that all drilled shaft installations be observed on a full-time basis by an experienced geotechnical engineer in order to evaluate that the soils encountered are consistent with the recommended design parameters. If the subsurface soil conditions encountered differ significantly from those presented in this report, supplemental recommendations will be required. The Geotechnical Engineer should observe the installation of drilled piers to verify the soil conditions and the diameter and depth of piers. Drilled piers should be constructed true and plumb.

Drilled pier end bearing surfaces must be thoroughly cleaned prior to concrete placement. A representative of the Geotechnical Engineer should inspect the bearing surface and foundation pier configuration. If the subsurface soil conditions encountered differ significantly from those presented in this report, supplemental recommendations will be required.

The contractor should check for gas and/or oxygen deficiency before any workers enter the excavation for observation and manual cleanup. All necessary monitoring and safety precautions as required by OSHA, State or local codes should be strictly enforced.

Gravel-Surfaced Drives and Parking

Subgrade Preparation

On most project sites, the site grading is accomplished relatively early in the construction phase. Fills are typically placed and compacted in a uniform manner. However, as construction proceeds, the subgrade may be disturbed due to utility excavations, construction traffic, desiccation, or rainfall/snow melt. As a result, the aggregate-surfaced roadway or parking area subgrade may not be suitable for construction traffic and corrective action will be required. The subgrade should be carefully evaluated at the time of construction for signs of disturbance or instability. We recommend the subgrade be thoroughly proofrolled with a loaded tandem-axle dump truck prior to final grading. The top 10 inches of the exposed subgrade should be scarified, moisture conditioned, and recompacted to at least 95 percent of the maximum dry unit weight as determined by ASTM D698 before any new fill or aggregate is placed.

Design Recommendations

Design of aggregate-surfaced roadways for the project has been based in general accordance with the "Aggregate-Surfaced Road Design Catalog" subsection of the 1993 AASHTO "Guide for the Design of Pavement Structures" and based on subsurface conditions observed at the site and laboratory test results.

The unpaved road sections for post-construction use have been developed under the following assumptions:

Aggregate Roadway Design Parameters		
Parameter	**Design Value**	**Comments**
Traffic Loading	5,000 ESALs [1]	Assumed
Design Life	30 years	Assumed
Design CBR	12	Tested value of 12
Resilient Modulus	12,500 psi (all-weather)	Based on CBR of 12
Aggregate Base Elastic Modulus	36,000 psi	Assumed
Allowable Rut Depth	2.0 inches	Assumed
Design Serviceability Loss	2.5	Assumed
Vehicle Tire Pressure	80 psi	Assumed

1. ESAL = 18 kips Equivalent Single Axle Load

As a minimum, we recommend the following options for unpaved access roads:

Typical Unpaved Road Section – Post Construction Traffic	
Base Course Thickness (inches)	**Traffic (ESALs)**
5[1, 2]	5,000

1. Minimum section thickness is anticipated to support fire trucks and pick-up trucks associated with on-going maintenance. Trucks containing heavy equipment may require localized repairs.
2. Base materials shall consist of Class II Base meeting requirements of the Caltrans Standard Specifications.

Quality roadway surfacing materials should consist of a blend of gravel, sand, and fines (clay and silt). We believe the maximum size particle should not exceed 1 inch in diameter and the gravel should be crushed with angular edges (not rounded). The blend

of materials should be selected to allow for easy compaction resulting in a firm, low permeable surface promoting surface drainage off the roadway surface. Materials meeting California Department of Transportation (CalTrans) Class II specifications can be used for aggregate surfacing material. Aggregate surfacing material should be placed in lifts not exceeding 6 inches and compacted to a minimum of 95 percent of the maximum dry unit weight as determined by ASTM D1557.

A quality roadway surfacing material should also contain approximately 10 to 25 percent fines (silt and clay-sized particles passing the No. 200 sieve). The fines should exhibit low to moderate plasticity (plastic index less than 15) and will act as a binder to help reduce risk for wash boarding. If the fines content of a roadway surfacing material is comprised mostly of silt, the fines will be non-plastic and the surfacing materials will not have the benefit of the binder or cohesive aspects.

In order to reduce dust, reclaimed asphalt pavement (RAP) may be used as the upper 2 to 4 inches of the aggregate-surfacing. The RAP should be graded to the specified limits for CalTrans Class II aggregate base course but modified to contain 10 to 25 percent fines and properly compacted. Periodic spraying (1 to 2 times a year following maintenance grading) of the surface with magnesium chloride or other dust suppressant may also be considered to reduce dust and wash boarding.

Aggregate-surfaced roadways performance is affected by its surroundings. In addition to providing preventive maintenance, the civil engineer should consider the following recommendations in the design and layout of aggregate-surfaced roadways:

- Site grades should slope a minimum of 10 percent away from the roadways;
- The subgrade and the aggregate-surfaced roadways have a minimum 10 percent slope to promote proper surface drainage;
- Consider appropriate edge drainage; and
- Install pavement drainage in surrounding areas anticipated for frequent wetting.

Maintenance

Periodic maintenance extends the service life of the aggregate-surfaced roadways and parking areas and should include re-grading and replacement of aggregate base course in any deteriorated areas. Thicker aggregate base course sections could be used to reduce the required maintenance and extend the service life of the aggregate-surfaced roadways. Design alternatives which could reduce the risk of subgrade saturation and improve long-term performance include installing surface drains next to any areas where surface water could pond. Properly designed and constructed subsurface drainage will reduce the time subgrade soils are saturated and can also improve subgrade strength and performance

Regardless of the design, un-surfaced roadways will display varying levels of wear and deterioration. We recommend an implementation of a site inspection program at a frequency

of at least once per year to verify the adequacy of the roadways. Preventative measures should be applied as needed for erosion control and re-grading. An initial site inspection should be completed approximately three months following construction.

Preventative maintenance should be planned and provided for through an on-going management program to enhance future roadway performance. Preventative maintenance activities are intended to slow the rate of deterioration, and to preserve the roadway investment.

Surfacing materials should not be placed when the surface is wet. Surface drainage should be provided away from the edge of roadways to reduce lateral moisture transmission into the subgrade.

If rut depths become excessive as construction work progresses, re-grading and re-compaction should be performed as necessary. Care should be taken to reduce or eliminate trafficking of the unpaved access road when the subgrade is wet as this will result in accelerated rutting conditions. Scarification, moisture treatment as necessary, and re-compaction of the roadways will likely be necessary as the roadways deteriorate.

General Comments

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials, or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-

party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client and is not intended for third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly effect excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety and cost estimating including excavation support and dewatering requirements/design are the responsibility of others. Construction and site development have the potential to affect adjacent properties. Such impacts can include damages due to vibration, modification of groundwater/surface water flow during construction, foundation movement due to undermining or subsidence from excavation, as well as noise or air quality concerns. Evaluation of these items on nearby properties are commonly associated with contractor means and methods and are not addressed in this report. The owner and contractor should consider a preconstruction/precondition survey of surrounding development. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

GeoModel

This is not a cross section. This is intended to display the Geotechnical Model only. See individual logs for more detailed conditions.

Model Layer	Layer Name	General Description
1	Upper Soils	Low bearing capacity soils within the upper 10 feet consisting of very loose to loose silty sand and medium stiff sandy silt
2	Lower Soils	Competent soils consisting of medium dense to very dense sands with varying amounts of silt and gravel, and sandy silt and lean clay, stiff to very stiff.

Legend

- Asphalt
- Poorly-graded Sand with Silt
- Sandy Lean Clay
- Silty Sand
- Sandy Silt

NOTES:
Layering shown on this figure has been developed by the geotechnical engineer for purposes of modeling the subsurface conditions as required for the subsequent geotechnical engineering for this project.
Numbers adjacent to soil column indicate depth below ground surface.

Exploration and Testing Procedures

Field Exploration

Number of Borings	Approximate Boring Depth (feet)	Location
5	26.5 or auger refusal	Proposed BESS Area
1	51.5 or auger refusal	Proposed Substation Area
5	5 to 10 feet	Infiltration Area

Boring Layout and Elevations: Terracon personnel provided the boring layout using handheld GPS equipment (estimated horizontal accuracy of about ±10 feet) and referencing existing site features. Approximate ground surface elevations were estimated using Google Earth. If elevations and a more precise boring layout are desired, we recommend borings be surveyed.

Subsurface Exploration Procedures: We advanced the borings with a truck-mounted drill rig using continuous hollow stem flight. Four samples were obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Test samples were collected during drilling in general accordance with the appropriate ASTM methods using Standard Penetration Testing (SPT) and sampling using either standard split-spoon or Modified California samplers. A sampling spoon was driven into the ground by a 140 pound automatic hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18 inch penetration was recorded as the Standard Penetration Test (SPT) resistance value, also referred to as N-values. The N-values are indicated on the boring logs at the test depths. The samples were placed in appropriate containers, taken to our soil laboratory for testing, and classified by a geotechnical engineer.

For safety purposes, all borings were backfilled with auger cuttings after their completion.

We also observed the boreholes while drilling and at the completion of drilling for the presence of groundwater. Groundwater was encountered in borings B-1, B-3, B-5 and B-6.

The sampling depths, penetration distances, and other sampling information was recorded on the field boring logs. The samples were placed in appropriate containers and taken to our soil laboratory for testing and classification by a Geotechnical Engineer. Our exploration team prepared field boring logs as part of the drilling operations. These field logs included visual classifications of the materials observed during drilling and our interpretation of the subsurface conditions between samples. Final boring logs were

prepared from the field logs. The final boring logs represent the Geotechnical Engineer's interpretation of the field logs and include modifications based on observations and tests of the samples in our laboratory.

Electrical Resistivity Testing: Soil electrical resistivity data was be obtained in accordance with ASTM G57 Standard Test Method for Field Measurement of Soil Resistivity Using the Wenner Four-Electrode Method. At the test location, two near perpendicular lines was tested. Electrode "a" spacings are summarized in the following table. Electrode spacing was adjusted to conform to site conditions.

No. of Test Locations	Electrode "a" Spacing (feet) [1]	Planned Location
2	2, 4, 6, 8, 12, 20, 30, 50, 70	Proposed BESS and Substation Areas

Laboratory Testing

The project engineer reviewed the field data and assigned laboratory tests. The laboratory testing program included the following types of tests:

- Moisture Content
- Dry Unit Weight
- Atterberg Limits
- Compaction
- Swell Consolidation Test
- Direct Shear
- Corrosivity
- Thermal Resistivity

The laboratory testing program often included examination of soil samples by an engineer. Based on the results of our field and laboratory programs, we described and classified the soil samples in accordance with the Unified Soil Classification System.

General Notes

Sampling	Water Level	Field Tests
	 Water levels indicated on the soil boring logs are the levels measured in the borehole at the times indicated. Groundwater level variations will occur over time. In low permeability soils, accurate determination of groundwater levels is not possible with short term water level observations.	N Standard Penetration Test Resistance (Blows/Ft.) (HP) Hand Penetrometer (T) Torvane (DCP) Dynamic Cone Penetrometer UC Unconfined Compressive Strength (PID) Photo-Ionization Detector (OVA) Organic Vapor Analyzer

Descriptive Soil Classification

Soil classification as noted on the soil boring logs is based Unified Soil Classification System. Where sufficient laboratory data exist to classify the soils consistent with ASTM D2487 "Classification of Soils for Engineering Purposes" this procedure is used. ASTM D2488 "Description and Identification of Soils (Visual-Manual Procedure)" is also used to classify the soils, particularly where insufficient laboratory data exist to classify the soils in accordance with ASTM D2487. In addition to USCS classification, coarse grained soils are classified on the basis of their in-place relative density, and fine-grained soils are classified on the basis of their consistency. See "Strength Terms" table below for details. The ASTM standards noted above are for reference to methodology in general. In some cases, variations to methods are applied as a result of local practice or professional judgment.

Location And Elevation Notes

Exploration point locations as shown on the Exploration Plan and as noted on the soil boring logs in the form of Latitude and Longitude are approximate. See Exploration and Testing Procedures in the report for the methods used to locate the exploration points for this project. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

Strength Terms

Relative Density of Coarse-Grained Soils
(More than 50% retained on No. 200 sieve.)
Density determined by Standard Penetration Resistance

Relative Density	Standard Penetration or N-Value (Blows/Ft.)	Ring Sampler (Blows/Ft.)
Very Loose	0 - 3	0 - 6
Loose	4 - 9	7 - 18
Medium Dense	10 - 29	19 - 58
Dense	30 - 50	59 - 98
Very Dense	> 50	> 99

Consistency of Fine-Grained Soils
(50% or more passing the No. 200 sieve.)
Consistency determined by laboratory shear strength testing, field visual-manual procedures or standard penetration resistance

Consistency	Unconfined Compressive Strength Qu (tsf)	Standard Penetration or N-Value (Blows/Ft.)	Ring Sampler (Blows/Ft.)
Very Soft	less than 0.25	0 - 1	< 3
Soft	0.25 to 0.50	2 - 4	3 - 4
Medium Stiff	0.50 to 1.00	4 - 8	5 - 9
Stiff	1.00 to 2.00	8 - 15	10 - 18
Very Stiff	2.00 to 4.00	15 - 30	19 - 42
Hard	> 4.00	> 30	> 42

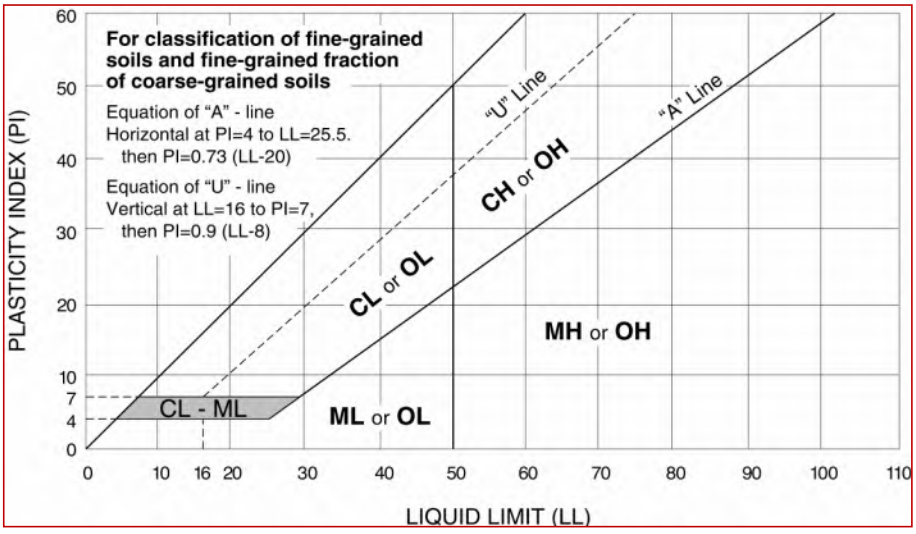
Relevance of Exploration and Laboratory Test Results

Exploration/field results and/or laboratory test data contained within this document are intended for application to the project as described in this document. Use of such exploration/field results and/or laboratory test data should not be used independently of this document.

Unified Soil Classification System

Criteria for Assigning Group Symbols and Group Names Using Laboratory Tests [A]				Soil Classification	
				Group Symbol	Group Name [B]
Coarse-Grained Soils: More than 50% retained on No. 4 sieve	**Gravels:** More than 50% of coarse fraction retained on No. 4 sieve	**Clean Gravels:** Less than 5% fines [C]	Cu≥4 and 1≤Cc≤3 [E]	GW	Well-graded gravel [F]
			Cu<4 and/or [Cc<1 or Cc>3.0] [E]	GP	Poorly graded gravel [F]
		Gravels with Fines: More than 12% fines [C]	Fines classify as ML or MH	GM	Silty gravel [F, G, H]
			Fines classify as CL or CH	GC	Clayey gravel [F, G, H]
	Sands: 50% or more of coarse fraction passes No. 4 sieve	**Clean Sands:** Less than 5% fines [D]	Cu≥6 and 1≤Cc≤3 [E]	SW	Well-graded sand [I]
			Cu<6 and/or [Cc<1 or Cc>3.0] [E]	SP	Poorly graded sand [I]
		Sands with Fines: More than 12% fines [D]	Fines classify as ML or MH	SM	Silty sand [G, H, I]
			Fines classify as CL or CH	SC	Clayey sand [G, H, I]
Fine-Grained Soils: 50% or more passes the No. 200 sieve	**Silts and Clays:** Liquid limit less than 50	**Inorganic:**	PI > 7 and plots above "A" line [J]	CL	Lean clay [K, L, M]
			PI < 4 or plots below "A" line [J]	ML	Silt [K, L, M]
		Organic:	$\frac{LL\ oven\ dried}{LL\ not\ dried} < 0.75$	OL	Organic clay [K, L, M, N]
					Organic silt [K, L, M, O]
	Silts and Clays: Liquid limit 50 or more	**Inorganic:**	PI plots on or above "A" line	CH	Fat clay [K, L, M]
			PI plots below "A" line	MH	Elastic silt [K, L, M]
		Organic:	$\frac{LL\ oven\ dried}{LL\ not\ dried} < 0.75$	OH	Organic clay [K, L, M, P]
					Organic silt [K, L, M, Q]
Highly organic soils:	Primarily organic matter, dark in color, and organic odor			PT	Peat

[A] Based on the material passing the 3-inch (75-mm) sieve.
[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.
[C] Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.
[D] Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay.
[E] $Cu = D_{60}/D_{10}$ $Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$
[F] If soil contains ≥ 15% sand, add "with sand" to group name.
[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.
[H] If fines are organic, add "with organic fines" to group name.
[I] If soil contains ≥ 15% gravel, add "with gravel" to group name.
[J] If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay.
[K] If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.
[L] If soil contains ≥ 30% plus No. 200 predominantly sand, add "sandy" to group name.
[M] If soil contains ≥ 30% plus No. 200, predominantly gravel, add "gravelly" to group name.
[N] PI ≥ 4 and plots on or above "A" line.
[O] PI < 4 or plots below "A" line.
[P] PI plots on or above "A" line.
[Q] PI plots below "A" line.



Appendix E
Paleontological Resources Assessment

MEMORANDUM

To:	RWE Clean Energy
From:	Shawna L. Johnson, PhD Paleontologist, Dudek
Subject:	Covina Reliability Project– Paleontological Resources Assessment
Date:	October 24, 2025
cc:	Elora Babbini, Keith Carwana, Sarah Siren, Dudek
Attachments:	A – Figures
	B – Confidential NHMLA Paleontological Records Search Results

Dudek has conducted an evaluation pursuant to the requirements of the California Environmental Quality Act (CEQA) and guidelines of the Society of Vertebrate Paleontology ([SVP] 2010) to determine the presence of and potential impacts related to paleontological resources associated with construction and operation of the proposed Covina Reliability Project (Project), located in the City of Covina, Los Angeles County, California (Figure 1-1 – Project Location). This technical memorandum provides the results of the paleontological resources investigation and was prepared by Shawna L. Johnson, MSc with editorial comments by Sarah Siren, MSc and Michael Williams, PhD.

To determine the paleontological sensitivity of the Project site, Dudek performed a paleontological resources inventory in compliance with the CEQA and SVP (2010) guidelines. The inventory consisted of a paleontological records search through the Natural History Museum of Los Angeles County (NHMLA), and a review of geological mapping and geological and paleontological literature. The results of the paleontological records search were negative for paleontological resources within the Project site.

1 Project Description and Location

The Project site is located in the City of Covina (City), north of San Bernardino Freeway/Interstate (I) 10 and south of I-210, in the southeast portion of Los Angeles County (County). The City is approximately 15 miles east of the City of Los Angeles.

The Project comprises two sites (east and west), with a total area of approximately 3.4 acres of private land, on Assessor's Parcel Numbers (APNs) 8429-008-029, 8429-008-028, 8429-007-007, 8429-007-006 and 8429-007-005 (Project site). The west site (APNs 8429-008-029 and 8429-008-028) is developed with two buildings currently operating with commercial, manufacturing, and light industrial uses and associated surface parking. The east site (APNs 8429-007-007, 8429-007-006 and 8429-007-005) is developed with a surface parking lot where recreational and commercial vehicles and boats are currently stored. The west site is bordered directly to the east by the Southern California Edison (SCE) Cortez Substation (APN 8429-008-800), which occupies approximately 1.32 acres of private land currently operating electrical distribution infrastructure. (Figure 1-1, Project Location).

The Project is designed to charge or discharge electricity to and from the grid via a battery energy storage system with associated on-site support components consisting of inverters, collector lines, fencing, access roads, supervisory control, a Supervisory Control and Data Acquisition (SCADA) system, and other ancillary facilities or equipment. The Project would include construction of an on-site Project substation on the west site, which will allow

interconnection to the existing and adjacent SCE Cortez Substation via an overhead generation transmission (gen-tie) line (Figure 1-2A and Figure 1-2B, Preliminary Site Improvement Plan). To facilitate operation of the Project, SCE would make various improvements to the Cortez Substation. SCE's improvements would occur within areas previously disturbed and occupied by existing electrical facilities. For the purpose of this analysis, the SCE Cortez Substation is considered an off-site impact area associated with the Project.

Project Substation

The Project substation would be the termination point of the 34.5-kilovolt (kV) medium voltage collection system. The power to and from the BESS would be passed through a final interconnection step-up transformer to convert it from 34.5kV to 66kV, which is the Project's interconnection voltage at the SCE Cortez Substation. The open-air Project substation would be on the southern portion of the west site adjacent to the SCE Cortez Substation as shown in the Preliminary Site Plan Improvements.

Generation Transmission and Collection Lines

Gen-Tie Line – West Site

The energy would be transported to and from the Project substation to the adjacent SCE Cortez Substation through a gen-tie line. The 66kV gen-tie line would be installed above ground from an approximately 50-foot point of change over (POCO) pole located within the Project substation, travel overhead approximately 90 feet into the SCE Cortez Substation, where it would connect to a 39-foot tall 66kV dead end switchyard structure, as described further below under SCE Cortez Substation Improvements. The 50-foot gen-tie POCO pole would be constructed of steel and would be at a height that is consistent with the existing equipment within the SCE Cortez Substation and the existing transmission lines along East Edna Place.

Collection Line

The Project would include a 34.5kV below-ground collection (feeder) line that would connect the east site to the west site and substation. As shown in Figure 1-1, Project Location, the collection line would extend from northeast corner of the east site, west along the south side of East Edna Place within a portion of the public right-of-way approximately 600 feet before turning south and interconnecting with the Project substation.

SCE Cortez Substation Improvements

In order to facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. Below is a summary of improvements to the SCE Cortez Substation:

a) Install facilities for a new 66kV switchrack position to terminate the Project's gen-tie line within the SCE Cortez Substation. This work includes the following:
   - One (1) 39-foot tall 66kV dead end switchyard structure
   - Two (2) 66kV voltage transformers with steel pedestal support structures
   - Three (3) 66kV line drops

- One (1) 66kV circuit breaker
- Three (3) 66kV group operated disconnect switches, one with grounding equipment
- Extend bus 1 position to the west within the SCE Cortez Substation fence line
- 200 feet of conductor from the 39-foot tall 66kV dead end structure within the SCE Cortez Substation to the Project's point of change in ownership location outside SCE Cortez Substation fence line.

b) Install telecommunications facilities:

- Approximately 150 feet of underground fiber optic cable and one (1) vault would extend fiber optic cable to the communications room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
- Approximately 150 feet of underground fiber optic cable and one (1) vault would extend the Project's diverse telecommunications into the communication room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
- Lightwave, channel, and associated equipment (including terminal equipment), supporting protection, remote terminal unit and SCADA requirements at the Project and SCE Cortez Substation.

2 Analysis Methodology

The analysis presented herein considers the potential environmental impacts of the Project relative to existing conditions. Establishment of the Project site's existing paleontological conditions have been informed by reviewing published geological maps and published and unpublished reports to identify geological units located on the Project site and determine their paleontological sensitivity.

A paleontological records search request was sent to the NHMLA on March 4, 2025. The records search area included the Project site and a one-mile radius buffer. The purpose of the records search was to determine whether there are any known fossil localities within or near the Project site to aide in determining whether a paleontological monitoring program is warranted to avoid or minimize potential adverse effects of construction on paleontological resources.

3 Paleontological Resources

Paleontological resources are the remains or traces of plants and animals that are preserved in the Earth's crust, and per SVP (2010) guidelines, are older than written history or older than approximately 5,000 years, which approximates the middle Holocene of Cohen et al. (2024). They are limited, nonrenewable resources of scientific and educational value and are afforded protection under state laws and regulations. This analysis complies with guidelines and significance criteria specified by CEQA and SVP (2010). Table 1, Paleontological Resource Sensitivity Criteria, provides definitions for high, undetermined, low, and no paleontological resource potential, or sensitivity, as set forth in and by the SVP (2010) Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources.

Table 1. Paleontological Resource Sensitivity Criteria

Resource Sensitivity/Potential	Definition
High	Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rocks units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcaniclastic formations (e. g., ashes or tephras), and some low-grade metamorphic rocks which contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e. g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones, etc.). Paleontological potential consists of both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Rock units which contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units which may contain new vertebrate deposits, traces, or trackways are also classified as having high potential.
Undetermined	Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine if these rock units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional paleontologist (see "definitions" section in this document) to specifically determine the paleontological resource potential of these rock units is required before a paleontological resource impact mitigation program can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.
Low	Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule, e. g. basalt flows or Recent colluvium. Rock units with low potential typically will not require impact mitigation measures to protect fossils.
No Sensitivity	Some rock units have no potential to contain significant paleontological resources, for instance high grade metamorphic rocks (such as gneisses and schists) and plutonic igneous rocks (such as granites and diorites). Rock units with no potential require no protection nor impact mitigation measures relative to paleontological resources.

3.1 Regulatory Framework

The California Environmental Quality Act

This paleontological resources evaluation was completed to satisfy the requirements of CEQA, which requires that all private and public activities not specifically exempted be evaluated against the potential for environmental impacts, including effects to paleontological resources. Paleontological resources, which are limited, nonrenewable resources of scientific, cultural, and educational value, are recognized as part of the environment under these state guidelines. This study satisfies Project requirements in accordance with CEQA (13 PRC [Public Resources Code], 15000 et seq.).

Paleontological resources are explicitly afforded protection by CEQA, specifically in Section VII(f) of CEQA Guidelines Appendix G, the "Environmental Checklist Form," which addresses the potential for adverse impacts to "unique paleontological resource[s] or site[s] or … unique geological feature[s]." This provision covers scientifically significant fossils, which include, but are not limited to, newly discovered species or genera, fossils exhibiting morphological features not previously recognized for a given animal group, fossils that increase the temporal range of the species, fossils discovered from geological units within which they were previously unknown, fossils that expand the biogeographic range of the species, and/or localities that yield fossils significant in their abundance, diversity, and preservation.

California Public Resources Code Section 5097.5

In addition to CEQA's requirements, Public Resources Code Section 5097.5 (Stats 1965, c 1136, p. 2792) regulates removal of paleontological resources from state lands, defines unauthorized removal of fossil resources as a misdemeanor, and requires mitigation of disturbed sites.

The Los Angeles County General Plan (2035)

Los Angeles County General Plan states that "over 1,000 fossil localities have been recorded in excess of a million specimens" (Los Angeles County 2015). Due to this high concentration of fossil resources, the General Plan includes goals and policies in the Chapter 9. Conservation and Natural Resources Element, Section 8- Historic, Cultural, and Paleontological Resources, that would protect paleontological resources. The goals and policies for Los Angeles County, that pertain to paleontological resources, are as follows:

Goal:
C/NR 14: Protected historic, cultural, and paleontological resources.

Policy:

C/NR 14.1: Mitigate all impacts from new development on or adjacent to historic, cultural, and paleontological resources to the greatest extent feasible.

C/NR 14.2: Support an inter-jurisdictional collaborative system that protects and enhances historic, cultural, and paleontological resources.

C/NR 14.5: Promote public awareness of historic, cultural, and paleontological resources.

C/NR 14.6: Ensure proper notification and recovery processes are carried out for development on or near historic, cultural, and paleontological resources.

Covina General Plan, Environmental Impact Report

The Environmental Impact Report for the Covina General Plan addresses paleontological resources and provides a mitigation measure to ensure protection of unknown paleontological resources. This mitigation measure is reproduced below:

Potential impacts on cultural resources must be analyzed on a case-by-case basis. If any paleontological or archaeological resources are discovered in conjunction with any construction at excavation activity, then the following measure is recommended as a condition of approval:

1. If any archaeological remains are uncovered during excavation or construction, work in the affected area will be suspended. In such an event, a recognized specialist from an established educational or other institution will be contacted to conduct a survey of the affected area. A preliminary determination will then be made by the City of Covina and the specialist as to the significance of die survey findings. This procedure will be a condition of approval for the proposed project. All actions under this measure will be in accordance with the State CEQA Guidelines.

3.2 Environmental Setting

Geological Literature, Map, and Geotechnical Report Review

The Project site is located within the northeastern portion of the Peninsular Ranges Geomorphic Province. The Peninsular Ranges Geomorphic Province consists of a series of northwest-trending mountain ranges separated by long valleys, formed from subparallel faults branching from the San Andreas Fault (California Geological Survey [CGS] 2002). The Project site is also located within the northeastern block of the Los Angeles Basin which also lies in the northern portion of the Peninsular Ranges Geomorphic Province. This block forms a triangular wedge about 35 miles long. The sedimentary rocks within this portion of the Los Angeles Basin are mainly marine clastic rocks of Cenozoic age that are overlain by Holocene (<11,700 years ago) and Pleistocene (11,700 – 2.58 million years ago [mya] alluvial deposits in low-lying areas (Yerkes et al. 1965).

According to surficial geological mapping by Tan (2000) at a 1:24,000 scale and the geological time scale of Cohen et al. (2024), the Project site is underlain by Holocene (Recent to 11,700 years ago) younger undivided alluvial fan and valley deposits, unconsolidated (map unit Qyf), and potentially underlain at depth by Pleistocene (11,700 years ago to 2.58 million years ago) older undivided alluvial fan and valley deposits, moderately to well consolidated (map unit Qof) which is mapped approximately 634 feet east-southeast of the Project site. The younger Holocene undivided alluvial fan and valley deposits have low paleontological sensitivity at the surface that increases to high sensitivity with depth. The older Pleistocene undivided alluvial fan and valley deposits, if encountered, have high paleontological sensitivity.

The geotechnical study conducted by Terracon (2024) did not differentiate any deposits based on geology, geologic mapping, or age, only by soils determinations. Most boreholes were drilled to a depth of 20 to 25 feet below ground

surface (bgs) and showed a more notable change in sediment (loose versus dense) between five and seven and a half feet (Terracon 2024). Whether this density change marks a difference in geological units is not clear. Tan (2000) states a major difference between the two geologic units as being the consolidation of the sediments, with the Holocene sediments being unconsolidated and the Pleistocene sediments being moderately to well-consolidated. Regardless of the geologic unit or sediments, the geotechnical plan recommends an over excavation of two feet below foundations, two feet beyond the outside edge of perimeter footings, and a minimum of 4 feet below existing grades (Terracon 2024).

Paleontological Literature Review

A search of paleontological literature (Jefferson [1991]) indicated there are numerous Pleistocene fossil localities in western Los Angeles County, and a search of online fossil locality databases produced localities that are nearby but are from older sediments than those that underlie the Project site, and therefore, are not applicable to this analysis.

Paleontological Records Search

The NHMLA paleontological records search results were received on March 16, 2025 (Confidential Attachment B). The NHMLA did not report any fossil localities from within the Project site; however, they did report several localities from the same or similar sediments as those that underlie the Project site. The nearest locality, LACM VP 1807, is located approximately 2.73 miles west-northwest of the Project site and produced a mammoth from an unknown Pleistocene formation, 115-120 feet bgs (Confidential Attachment B).

4 Impact Analysis and Conclusions

4.1 Thresholds of Significance

The thresholds of significance used to evaluate the impacts of the proposed Project related to paleontological resources are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. A significant impact under CEQA would occur if the proposed Project would:

b) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

4.2 Impact Analysis

a) Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less Than Significant Impact with Mitigation Incorporated. No known paleontological resources were identified within the Project site, including the adjacent SCE Cortez Substation, as a result of the institutional records search or desktop geological and paleontological review (Appendix F). In addition, the Project site is not anticipated to be underlain by unique geologic features. The Project site is underlain by Holocene younger undivided alluvial fan and valley deposits, unconsolidated and at depth by Pleistocene older undivided alluvial fan and valley deposits, moderately to well consolidated. Holocene younger undivided alluvial fan and valley deposits have low paleontological sensitivity at the surface that increases

to high paleontological sensitivity with depth. If encountered, which is dependent on the depth of excavations, Pleistocene older undivided alluvial fan and valley deposits, would have high paleontological sensitivity. The geotechnical report suggests a difference in sediment densities that may indicate the transition into Pleistocene age sediments at 5 feet below ground surface. Institutional records searches and literature review show that fossils have been found from the same sediments that underlie the Project site, from as close as 2 miles away, which supports the finding of high sensitivity for these sediments. If intact paleontological resources are located on site, ground-disturbing activities associated with construction of the Project, such as grading during site preparation, large diameter (2 feet or greater) augering and boreholes, and trenching for utilities, have the potential to destroy a unique paleontological resource or site. As such, the Project site is considered to be potentially sensitive for paleontological resources, and without monitoring, the potential damage to paleontological resources during construction associated with the Project is considered a potentially significant impact. Given the potential for Pleistocene sediments at depth, the Project site is highly sensitive for supporting paleontological resources below the depth of fill and younger sediments. Mitigation measures (**MM-GEO-1** and **MM-GEO-2**), presented below, would reduce potentially significant impacts to a less-than-significant level. Therefore, the Project would have a **less than significant impact with mitigation incorporated**..

MM-GEO-1 Retain a Qualified Paleontologist

Retain a Qualified Paleontologist. Prior to commencement of any grading activity on-site, the Applicant would retain a qualified paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines to prepare and implement a Paleontological Resources Mitigation and Monitoring Plan (PRMMP) for the Project. The PRMMP shall be consistent with the SVP (2010) guidelines and would outline requirements for preconstruction meeting attendance and worker environmental awareness training; where monitoring is required within the Project site based on construction plans and/or geotechnical reports; procedures for adequate paleontological monitoring and discoveries treatment; and paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. The qualified paleontologist or their designee shall attend the preconstruction meeting, and a qualified paleontological monitor shall be on-site during all rough grading and other significant ground-disturbing activities (including augering) in previously undisturbed, fine-grained Pleistocene alluvial deposits at depths starting at 5 feet or deeper and monitoring would conclude once ground disturbance below this depth is complete.

MM-GEO-2 Paleontological Resource Discovery

In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor will temporarily halt and/or divert grading activity to allow recovery of paleontological resources. The area of discovery will be roped off with a 50-foot radius buffer. Once documentation and collection of the find is completed, the monitor would remove the rope and allow grading to recommence in the area of the find. Costs for laboratory processing and curation fees are the responsibility of the Applicant.

Implementation of these mitigation measures will ensure that the Project and associated SCE improvements would further avoid or minimize impacts to paleontological resources. Impacts related to paleontological resources would, therefore, be **less than significant.**

Dudek
Attn: Shawna Johnson

re: Paleontological resources records search for the Covina Reliability Project (PN: 14182.06)

Dear Shawna:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Covina Reliability project area as outlined on the portion of the Baldwin Park USGS topographic quadrangle map that you sent to me via e-mail on March 4, 2025. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that may occur in the proposed project area, either at the surface or at depth.

The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).

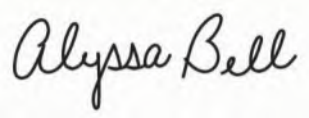
Locality Number	Location	Formation	Taxa	Depth
LACM VP 1807	Manning Gravel Pits, Irwindale	Unknown formation (Pleistocene)	Mammoth (*Mammut*)	115 - 120 ft bgs
LACM VP 1728	W of intersection of English Rd & Peyton Dr, Chino	Unknown (light brown shale with interbeds of very coarse brown sand; Pleistocene)	Horse (*Equus*), camel (*Camelops*)	15-20 ft bgs
LACM VP 7508	Near intersection of Vellano Club Dr. and Palmero Dr., Oakcrest Development; N of Serrano Canyon, Chino Hills	Unknown formation (Pleistocene)	Ground sloth (*Nothrotheriops*); elephant family (Proboscidea); horse (*Equus*)	Unknown
LACM VP 2027	1600 block, Bridgen Rd., Pasadena	Unknown formation (Pleistocene)	Mammoth (*Mammuthus*)	Unknown

VP, Vertebrate Paleontology; IP, Invertebrate Paleontology; bgs, below ground surface

This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be

conducted by a paleontologist meeting Federal (43 Code of Federal Regulations Part 49.110) or Society of Vertebrate Paleontology standards.

Sincerely,



Alyssa Bell, Ph.D.
Natural History Museum of Los Angeles County

Appendix F

Greenhouse Gas Emissions Technical Report

MEMORANDUM

To:	Kimberly Comacho, Covina Reliability Project, LLC
From:	Adam Poll, Dudek
Subject:	Covina Reliability Project Greenhouse Gas Emissions Technical Memorandum
Date:	November 19, 2025
cc:	Elora Babbini, Dudek
Attachment:	Attachment A – CalEEMod Emissions Outputs

Dudek is pleased to present Covina Reliability Project, LLC (Applicant) with the following greenhouse gas (GHG) emissions analysis for the proposed Covina Reliability Project (Project) located within the City of Covina (City). The Project proposes the development of an approximately 110-megawatt (MW)/440 MW-hour battery energy storage system (BESS) facility.

This memorandum estimates GHG emissions and impacts from construction and operation of the Project in accordance with the California Environmental Quality Act (CEQA) Guidelines. As further described below, this memorandum confirms that the Project will not result in significant impacts in the form of GHG emissions based on the applicable thresholds of significance.

1 Project Description

The Project is designed to charge or discharge electricity to and from the grid via BESS with associated on-site support components consisting of battery enclosures, inverters, collector lines, fencing, access roads, supervisory control, a Supervisory Control and Data Acquisition (SCADA) system, and other ancillary facilities or equipment. The Project would also include an on-site Project substation on the west site that will allow interconnection to the adjacent SCE Cortez Substation via an overhead gen-tie line.

Utilizing similar battery technology used in electric vehicles, the Project would provide additional capacity to the electrical grid to assist with serving load during periods of peak demand by charging when demand is low and discharging when demand is high. This accommodates the integration of additional intermittent renewables such as wind and solar and reduces the need to operate natural gas power plants. The Project would also serve as an additional local capacity resource that would enhance grid reliability.

The Project is expected to create approximately 40 jobs during construction, many of which can be sourced from the City and adjacent cities. The Project would be operated remotely, with weekly visits by one to two workers in a light utility truck for routine inspections. Periodic on-site maintenance, including occasional equipment replacement and electrical repairs, would be performed as needed by regional employees and contractors.

Battery Energy Storage System

The Project would include placement of battery energy storage enclosures and associated electrical equipment, including medium voltage transformers and power conversation systems. Each unit consists of a storage enclosure/non-occupiable steel cabinet that houses battery modules and power conversion system equipment. The

battery storage units are prefabricated off site and would arrive to the site fully assembled and ready to be installed and operated. The actual number of energy storage enclosures and types are approximate and subject to change based on available battery technology at the time of construction. Each battery energy storage enclosure would have insulation, a module cooling system, a battery management system, fire detection equipment, power conversion system (PCS) equipment containing the electronic controls, inverters, and a medium voltage step-up transformer. The primary storage components would consist of self-contained electrochemical battery systems using conventional storage technologies with proven safety and performance records. The BESS enclosures would be designed such that the periodic maintenance and replacement of underperforming battery components can be easily performed on an as-needed basis without replacing the entire module.

Fire detection measures are incorporated in the Project design in accordance with National Fire Protection Association (NFPA) safety standards. It should be noted that selection of batteries would be based on supply chain considerations;[1] as such, the capacity and size of the containers may change, as may the ratings of the conversion equipment (inverters and transformers). The number of containers, inverters, and transformers and expected total megawatt capacity are an estimate based on currently available technology and are similar to components typically found in BESS facilities. While the battery technology may change, the overall development footprint of the Project would remain consistent. As further described herein, anticipated minor alterations to the configuration of the BESS containers and related facilities within the Project footprint would not substantially change the Project design in a manner that would result in new significant environmental impacts or substantially increase the severity of impacts identified in this IS/MND.[2] Individual lithium-ion, or similar technology, battery cells form the core of the BESS. Cells are assembled either in series or parallel connection in sealed battery modules. The battery modules would be installed in self-supporting racks electrically connected either in a series or parallel to each other. The individual battery racks are connected in series or parallel configuration to deliver the BESS power rating. The battery racks would be fused.

The BESS facility would be unstaffed and would include remote operational control. The BESS facility would be uninhabited with no bathroom facilities, running water, or office space. Project operations would be monitored remotely through the SCADA system that would be housed in an enclosure adjacent to the Project substation. Periodic inspections and maintenance activities would occur on the Project site.

Project Substation

The Project substation would be the termination point of the 34.5-kilovolt (kV) medium voltage collection system. The power to and from the BESS would be passed through a final interconnection step-up transformer to convert it from 34.5kV to 66kV, which is the Project's interconnection voltage at the SCE Cortez Substation. The open-air Project substation would be on the southern portion of the west site adjacent to the SCE Cortez Substation as shown in the Preliminary Site Plan Improvements.

Operations and Maintenance

Once constructed, the Project would operate 7 days per week, 365 days per year. The facility would be remotely monitored by the original equipment manufacturer and the Applicant. Project operations would be monitored

1 The battery energy storage enclosures are manufactured by Tesla, Fluence, LG Chem, and a number of other manufacturers. The specific manufacturer will be selected at a future date based on supply chain considerations and available battery technology at the time of construction.

2 *Residents Against Specific Plan 380 v. County of Riverside* (2017) 9 Cal.App.5th 941.

remotely through the SCADA system. The Project would include one single story control enclosure for the SCADA system (approximately 400 to 700 square feet and a height of about 15 feet) near the Project substation.

During operation of the Project substation, operation and maintenance staff would visit the substation periodically for maintenance activities. Routine operations would require one or two workers in a light utility truck to visit the facility on a weekly basis.

Periodic augmentation of batteries within the Project site would occur to maintain the capacity over an approximate 30-year life. Occasionally, on-site maintenance would be required, which may include replacement of equipment and miscellaneous electrical repairs on an as-needed basis. No permanent sanitary facilities would be required. Maintenance trucks would be utilized to perform routine maintenance, including but not limited to equipment testing, monitoring, repair, routine procedures to ensure service continuity, and standard preventative maintenance. Typically, one major maintenance inspection would take place annually.

Generation Transmission and Collection Lines

Gen-Tie Line – West Site

The energy would be transported to and from the Project substation to the adjacent SCE Cortez Substation through a gen-tie line. The 66kV gen-tie line would be installed above ground from an approximately 50-foot point of change over (POCO) pole located within the Project substation, travel overhead approximately 90 feet into the SCE Cortez Substation, where it would connect to a 39-foot tall 66kV dead end switchyard structure, as described further below under SCE Cortez Substation Improvements. The 50-foot gen-tie POCO pole would be constructed of steel and would be at a height that is consistent with the existing equipment within the SCE Cortez Substation and the existing transmission lines along East Edna Place.

Collection Line

The Project would include a 34.5kV below-ground collection (feeder) line that would connect the east site to the west site and substation. The collection line would extend from northeast corner of the east site, west along the south side of East Edna Place within a portion of the public right-of-way approximately 600 feet before turning south and interconnecting with the Project substation.

Perimeter Fencing, Landscaping, Signage, and Lighting

The Project site would be enclosed by an 8-foot-tall perimeter concrete block wall and include wrought iron gates to enter the site. The primary purpose of the wall and rolling driveway gates, which would be equipped with a keypad, is to prevent unauthorized access to the site and to provide a buffer between the Project and surrounding uses. The portions of the Project site that front East Edna Place would be landscaped.

Low elevation (less than 14 feet) controlled security lighting would be installed throughout the site as necessary. Lighting installed as part of the Project would be required to incorporate light-emitting diode (LED) lighting for parking areas, entryways, and pedestrian areas, including wall-mounted motion-sensor LED lights on both the interior and exterior of the proposed concrete wall. Operational lighting would only be switched on when personnel enter the area through a manual activation (switch). All fixtures would be downward-directed and shielded to prevent light trespass and comply with applicable light-pollution standards.

Drainage Improvements

The Project proposes to match drainage patterns to those of existing conditions. The Project would redevelop the existing impervious surface lots to include pervious landscape and gravel areas, resulting in an overall increase in pervious area compared to existing conditions. Although detention is not required due to the Project's proposed increases to perviousness and improved infiltration capacity, the Project would include two bioretention basins designed to meet Low Impact Development (LID) standards and treat on-site runoff consistent with the City's MS4 permit requirements. Once operational, runoff would continue to surface flow generally south and southwest, discharging into the two respective bioretention basins for treatment and infiltration. Flows that exceed the basin capacity during large storm events would weir overflow south onto the Metrolink railroad tracks. Subsurface storm drain infrastructure is not proposed.

SCE Cortez Substation Improvements

In order to facilitate operation of the Project, SCE would make improvements to the SCE Cortez Substation to accommodate new equipment. These improvements would be made within the existing SCE substation footprint, would be within areas previously disturbed, and would be of a similar height and scale as existing improvements within the SCE Cortez Substation. Below is a summary of improvements to the SCE Cortez Substation:

- Install facilities for a new 66kV switchrack position to terminate the Project's gen-tie line within the SCE Cortez Substation. This work includes the following:
  - One (1) 39-foot tall 66kV dead end switchyard structure
  - Two (2) 66kV voltage transformers with steel pedestal support structures
  - Three (3) 66kV line drops
  - One (1) 66kV circuit breaker
  - Three (3) 66kV group operated disconnect switches, one with grounding equipment
  - Extend bus 1 position to the west within the SCE Cortez Substation fence line
  - 200 feet of conductor from the 39-foot tall 66kV dead end structure within the SCE Cortez Substation to the Project's point of change in ownership location outside SCE Cortez Substation fence line.
- Install telecommunications facilities:
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend fiber optic cable to the communications room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
  - Approximately 150 feet of underground fiber optic cable and one (1) vault would extend the Project's diverse telecommunications into the communication room at the SCE Cortez Substation. Approximately 55 feet of 1-to-5-inch conduit would also be installed from the relay house to the new vault within a trench that would be approximately 18 inches wide and 36 inches deep.
- Lightwave, channel, and associated equipment (including terminal equipment), supporting protection, remote terminal unit and SCADA requirements at the Project and SCE Cortez Substation.

2 General Analysis and Methodology

The Project site is located within the South Coast Air Basin (SCAB) and is within the jurisdictional boundaries of the South Coast Air Quality Management District (SCAQMD), which has jurisdiction over Los Angeles County (County) where the Project is located.

GHGs are gases that absorb infrared radiation in the atmosphere. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature. Global climate change concerns are focused on whether human activities are leading to an enhancement of the greenhouse effect. Principal GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), O_3, and water vapor. If the atmospheric concentrations of GHGs rise, the average temperature of the lower atmosphere will gradually increase. Globally, climate change has the potential to impact numerous environmental resources though uncertain impacts related to future air temperatures and precipitation patterns. Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. Climate change is already affecting California: average temperatures have increased, leading to more extreme hot days and fewer cold nights; shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year; sea levels have risen; and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (Climate Action Team [CAT] 2010).

The effect each GHG has on climate change is measured as a combination of the mass of its emissions and the potential of a gas or aerosol to trap heat in the atmosphere, known as its global warming potential (GWP), which varies among GHGs. Total GHG emissions are expressed as a function of how much warming would be caused by the same mass of CO_2. Thus, GHG emissions are typically measured in terms of pounds or tons of CO_2 equivalent (CO_2e). The CO_2e for a gas is derived by multiplying the mass of the gas by the associated GWP, such that metric tons (MT) of CO_2e = (MT of a GHG) × (GWP of the GHG). The California Emissions Estimator Model (CalEEMod) assumes that the GWP for CH_4 is 25, which means that emissions of one MT of CH_4 are equivalent to emissions of 25 MT of CO_2, and the GWP for N_2O is 298, based on the Intergovernmental Panel on Climate Change's (IPCC's) Fourth Assessment Report (IPCC 2007).

GHG emissions associated with construction of the Project were estimated for the following emission sources: operation of off-road construction equipment, on-road vendor trucks, and worker vehicles. GHG emission sources associated with operation of the Project conservatively include area, energy, mobile, offroad, solid waste, stationary, water, and wastewater categories. The Project would be operated remotely with no permanent on-site operations and a limited number of maintenance personnel, and no occupied buildings or habitable structures. In addition, the BESS facility would be uninhabited with no bathroom facilities, running water, or office space. As such, solid waste, water, and wastewater emissions are not anticipated to be included in Project operations. However, these sources are still conservatively included in the assessment and estimated herein. The detailed Project construction and operational assumptions are included in Attachment A.

2.1 Construction

CalEEMod Version 2022.1.1.30 was used to estimate emissions from construction of the Project (California Air Pollution Control Officers Association [CAPCOA] 2025). CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify GHG emissions associated with construction activities and operation of a variety of land use projects, such as residential, commercial, and industrial facilities. CalEEMod

input parameters, including the land use type used to represent the Project and its size, construction schedule, and anticipated use of construction equipment, were based on information provided by the Applicant or default model assumptions if Project specifics were unavailable.

For purposes of estimating Project emissions (including on-site and off-site construction activities) and based on information provided by the Applicant and engineers, construction of the Project would commence in October 2025[3] and would last approximately 14 months, ending in November 2026.[4] The Project is assumed to have a 30-year lifespan (i.e., ending in 2056) and at the end of operation will be decommissioned. However, the EMFAC and OFFROAD models in CalEEMod only have emission factors through 2050. As such, the year 2050 was assumed for estimating emissions from the decommissioning phase. The analysis contained herein is based on the following assumptions (duration of phases are approximate):

- Demolition of Existing Facilities / Site Preparation – 2 months
- Grading – 1 month
- Collector Substation Installation – 5 months
- Battery/Container Installation – 6 months
- SCE Substation Construction/Upgrades – 12 months
- Gen-tie Installation – 3 months[5]
- Decommissioning – 6 months (year 2056)

Tier 4 Final offroad equipment would be used during construction. The SCE required improvements conservatively assumed a default tier mix. The construction equipment mix and vehicle trips used for estimating the Project-generated construction emissions are shown in Table 1, Construction Scenario Assumptions.

Table 1. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Average Daily Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Demolition of Existing Facilities / Site Preparation	40	0	12	Excavators	1	8
				Graders	1	8
				Rubber Tired Loaders	1	8
				Skid Steer Loaders	1	8
				Tractors/Loaders/ Backhoes	1	8
				Generator Sets	1	8
Grading	40	2	4	Graders	1	8

[3] The analysis assumes a construction start date of October 2025, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

[4] The analysis assumes overlap of construction phases. See Attachment A for detailed construction schedule assumptions.

[5] For modeling purposes the gen-tie line construction was assumed to be up to 3 months but will likely be less.

Table 1. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Average Daily Haul Truck Trips	Equipment Type	Quantity	Usage Hours
				Tractors/Loaders/ Backhoes	1	8
				Skid Steer Loaders	1	8
				Generator Sets	1	8
Collector Substation Installation	40	4	4	Tractors/Loaders/ Backhoes	1	8
Battery/Container Installation	12	14	4	Rubber Tired Loaders	1	8
				Excavators	1	8
				Rough Terrain Forklifts	1	8
				Cranes	1	8
				Graders	1	8
				Skid Steer Loaders	1	8
				Welders	1	8
				Generator Sets	1	8
				Paving Equipment	1	8
				Rollers	1	8
SCE Substation Construction/ Upgrades	36	28	0	Cranes	1	3
				Forklifts	2	3
				Generator Sets	4	3
				Air Compressors	1	8
				Sweepers	1	4
				Tractors/Loaders/ Backhoes	1	8
				Trenchers	1	8
Gen-tie Installation	10	4	4	Tractors/Loaders/ Backhoes	1	8
				Concrete/Industrial Saws	1	8
				Other General Industrial Equipment	1	8
Decommissioning	40	10	8	Tractors/Loaders/ Backhoes	1	8
				Cranes	1	8

Source: See Attachment A.

Vendor trucks transporting building materials were assumed for building construction. The Project is assumed to require 750 cubic yards of cut and 400 cubic yards of fill, with 350 cubic yards of export during grading. Additional details regarding construction assumptions are provided in the modeling output, Attachment A.

2.2 Operations

The project site is currently occupied by two buildings with commercial, manufacturing, and light industrial uses and associated surface parking. The existing operational emissions were modeled using the CalEEMod with the following assumptions.

Existing Site

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated with landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day), as well as number of summer days (when landscape maintenance would generally be performed, 180 days) and winter days. The Project Applicant, as a project design feature and condition of approval, has committed to requiring all landscaping equipment to be electric.

Energy Sources

As represented in CalEEMod, energy sources include GHG emissions associated with building electricity and natural gas usage (non-hearth). Electricity use would contribute indirectly to GHGs, since GHG emissions occur at the site of the power plant, which is typically off site. Emissions were calculated by multiplying the energy use by the utility's carbon intensity (pounds of GHGs per megawatt-hour for electricity or 1,000 British thermal units for natural gas) for carbon dioxide (CO_2) and other GHGs. Annual electricity emissions were estimated in CalEEMod using the emissions factors for Southern California Edison, which would be the energy source provider for the existing site. The electricity and natural gas demand for the existing site was based on CalEEMod defaults.

Mobile Sources

The existing site generates criteria pollutant emissions from mobile sources (vehicular traffic) as a result of the employees and customers. CalEEMod default data, including trip rates, trip lengths, trip characteristics, and emissions factors, were used for the model inputs. Traffic was assumed to include a mixture of vehicles in accordance with the associated use, as modeled within the CalEEMod. Emission factors representing the vehicle mix and emissions for 2025 for the existing site were used to estimate emissions associated with vehicular sources.

Refrigerants

Refrigerants are substances used in equipment for air conditioning (A/C) and refrigeration. Most of the refrigerants used today are HFCs or blends thereof, which can have high GWP values. All equipment that uses refrigerants has a charge size (i.e., quantity of refrigerant the equipment contains), and an operational refrigerant leak rate, and each refrigerant has a GWP that is specific to that refrigerant. CalEEMod quantifies refrigerant

emissions from leaks during regular operation and routine servicing over the equipment lifetime, and then derives average annual emissions from the lifetime estimate. The default CalEEMod assumptions for the existing land use were assumed.

Solid Waste

The existing land use generates solid waste and would, therefore, result in CO_2 and methane (CH_4) emissions associated with landfill off-gassing. Solid waste generation was derived from the CalEEMod default rates for each land use type. Emission estimates associated with solid waste were estimated using CalEEMod.

Water Supply and Wastewater

Water supplied to the existing site requires the use of electricity. Accordingly, the supply, conveyance, treatment, and distribution of water would indirectly result in GHG emissions through use of electricity. Annual water use for the existing site and GHG emissions associated with the electricity used for water supply were calculated based upon default water use estimates for each land use type, as estimated by CalEEMod and Southern California Edison factors. The existing site is connected to municipal sewer. Default water use estimated from CalEEMod for indoor and outdoor water use were assumed.

Project

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from landscape maintenance equipment, which was conservatively included herein.

During operations and maintenance, GHG emissions would include fugitive emissions from equipment containing SF_6 gas installed at the proposed collector substation. SF_6 has a GWP of 23,900 using CO_2 at a reference value of 1 (IPCC 2007). The collector substation would include 138 kilovolt (kV) breakers that would contain SF_6 gas. It is estimated that the Project would maintain a total of 500 pounds (lbs) of SF_6 gas at the collector substation. Although leakage is unlikely, for the purposes of the Project's emissions inventory, it was assumed that the breakers would have a maximum annual leak rate of 0.5% in accordance with the Institute of Electrical and Electronics Engineers (IEEE) PC37.122 - Standard for High Voltage Gas-Insulated Substations Rated Above 52 kV (IEEE 2018). Emissions from SF_6 gas are included as part of area source emissions.

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity. The Project would use electricity for lighting, heating, ventilation, and air conditioning, and fire suppression systems along with losses during transmission to and from the grid. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, since criteria pollutant emissions occur at the site of the power plant, which is typically off-site. The auxiliary energy use associated with the Project was provided by the Applicant and estimated to be 4,818,000 kilowatt-hours per year.

Emissions are calculated by multiplying the energy use by the utility carbon intensity (pounds of GHGs per kilowatt-hour for electricity or 1,000 British thermal units for natural gas) for CO_2 and other GHGs. Annual electricity emissions were estimated in CalEEMod using the emissions factors for SCE, which would be the energy source provider for the

Project. CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt-hour) for SCE is based on the value for SCE's energy mix in 2021.

Offroad Sources

During irregular maintenance, the Project may require the movement or replacement of battery enclosures during the lifetime of the Project. As such, the use of a crane was assumed to assist the lifting and movement of the BESS containers. CalEEMod was used to estimate emissions of the crane assuming 1 day of operation every 5 years.

Mobile Sources

Following the completion of construction activities, the Project would generate criteria pollutant emissions from mobile sources (vehicular traffic) as a result of the periodic maintenance of the Project. The Project was assumed to require up to 4 employees twice per month visiting the site for maintenance.[6] The estimated trip lengths and trip modes were based on CalEEMod defaults. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Attachment A). CalEEMod default data, including temperature, trip characteristics, variable start information, emissions factors, and trip distances, were conservatively used for the model inputs. Project-related traffic was assumed to include a mixture of vehicles in accordance with the associated use, as modeled within CalEEMod, which is based on the California Air Resources Board (CARB) EMFAC2021 model. Emission factors representing the vehicle mix and emissions for 2027 were used to estimate emissions associated with vehicular sources.

Solid Waste

The Project would be operated remotely with no permanent on-site operations or bathroom facilities. However, CalEEMod default values for solid waste generation (based on the general light industry land use) were used to conservatively estimate GHG emissions associated with solid waste.

Stationary Sources

Following the completion of construction activities, the Project would generate criteria pollutant emissions from maintenance and testing of a backup diesel emergency generator. It was assumed that the generator is rated at 400 horsepower and would operate up to 200 hours per year for maintenance and testing purposes and potential emergency use. CalEEMod default emission factors were assumed.

Water

Supply, conveyance, treatment, and distribution of water for the Project require the use of electricity, which would result in associated indirect GHG emissions. No wastewater would be generated by the Project. The electricity consumption from outdoor water use was conservatively estimated using CalEEMod default values for the Project.

[6] Although not quantitatively assessed in the Project modeling, mobile source emissions compared to existing baseline conditions will be substantially reduced, given that the current site includes two developed industrial and manufacturing buildings that generate mobile source emissions through vehicles accessing the property.

CalEEMod was used to estimate the gain of sequestered carbon that would result from the planting and growth of trees on-site (refer to Attachment A). However, this estimate was conservatively not included in the analysis herein.

3 Greenhouse Gas Emissions Assessment

3.1 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to GHG emissions are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to GHG emissions would occur if the project would:

A. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.
B. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established quantitative thresholds in Appendix G for assessing whether the GHG emissions of a project, such as the Project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated at a project level under CEQA.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). The State of California has not adopted emission-based thresholds for GHG emissions under CEQA. The Governor's Office of Planning and Research's Technical Advisory, titled "Discussion Draft CEQA and Climate Change Advisory," states that

> "Neither the CEQA statute nor the CEQA Guidelines prescribe thresholds of significance or particular methodologies for perming an impact analysis. This is left to lead agency judgment and discretion, based upon factual data and guidance from regulatory agencies and other sources where available and applicable. Even in the absence of clearly defined thresholds for GHG emissions, such emissions must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact. (OPR 2018) Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice." Section 15064.7(c) of the CEQA Guidelines specifies that "when adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

OPR Guidance

The OPR's Technical Advisory titled *CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review* states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2008). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2008).

SCAQMD

SCAQMD formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. In December 2008, SCAQMD adopted an interim 10,000 metric tons (MT) of CO_2 equivalent (CO_2e) per year screening level threshold for stationary-source/industrial projects for which SCAQMD is the lead agency. From December 2008 through September 2010, SCAQMD hosted working group meetings and revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. SCAQMD has continued to consider adoption of significance thresholds for residential and general land use development projects. The most recent proposal, issued in September 2010, uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

Tier 1 Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.

Tier 2 Consider whether or not the proposed project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.

Tier 3 Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 MT CO_2e per year threshold for industrial uses would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT CO_2e per year), commercial projects (1,400 MT CO_2e per year), and mixed-use projects (3,000 MT CO_2e per year). Under option 2, a single numerical screening threshold of 3,000 MT CO_2e per year would be used for all non-industrial projects. If the project generates emissions in excess of the applicable screening threshold, move to Tier 4.

Tier 4 Consider whether the project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of AB 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT CO_2e per service population for project level analyses and 6.6 MT CO_2e per service population for plan level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.

Tier 5 Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

The 3,000 MT CO_2e per year threshold was proposed a decade ago and was never adopted. However, the 3,000 MT CO_2e per year threshold was developed and recommended by SCAQMD, an expert agency, based on substantial evidence as provided in the Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (SCAQMD 2008) and subsequent Working Group meetings (latest in 2010). This threshold uses the Executive Order S-3-05 goal as the basis, so it is not tied to only the 2020 target year and is thus not outdated. This threshold is also based on the 90% capture rate methodology, which means that 90% of total emissions from all new or modified projects would be subject to some type of CEQA analysis, which was the approach taken by SCAQMD to establish the stationary/industrial source threshold and by CARB (for interim threshold for stationary source projects); it was also one of the options suggested by the California Air Pollution Control Officers Association (quantitative threshold based on market capture). Further, this threshold has been used for hundreds, if not thousands, of GHG analyses performed for projects located within SCAQMD's jurisdiction.

Under Tier 3 option 2, the recommended SCAQMD threshold to apply to the Project is the 3,000 MT CO_2e per year for all non-industrial projects. Per the SCAQMD guidance, construction emissions should be amortized over the operational life of the Project, which is assumed to be 30 years (SCAQMD 2008). This impact analysis, therefore, adds amortized construction emissions to the estimated annual operational emissions, and then compares operational emissions to the proposed SCAQMD threshold of 3,000 MT CO_2e per year.

This analysis also considers consistency with regulations or requirements adopted by the 2008 Climate Change Scoping Plan (Scoping Plan) and subsequent updates and the SCAG 2024 RTP/SCS.

3.2 Impact Analysis

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction and Decommissioning Emissions

Both construction and decommissioning of the Project including SCE improvements would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. As stated above, the SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime; therefore, the total construction GHG emissions were calculated, amortized over 30 years, and added to the operational emissions. For conservative purposes, GHG emissions associated with decommissioning have also been amortized and have been added to the operational emissions.

CalEEMod was used to estimate GHG emissions during construction and decommissioning. Construction of the Project is anticipated to last up to 14 months. On-site sources of GHG emissions include off-road equipment and off-site sources include on-road vehicles (vendor trucks and worker vehicles). Decommissioning is assumed to last up to 7 months and includes similar on-site and off-site sources of GHG emissions. Table 2 presents construction GHG emissions for the Project from on-site and off-site construction and decommissioning emission sources.

Table 2. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2025	82.58	<0.01	<0.01	84.08
2026	720.79	0.03	0.04	733.96
2050[1]	136.72	<0.01	0.01	138.64
			Total	**956.68**
			Annualized emissions over 30 years (metric tons per year)	***31.89***

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent; GHG = greenhouse gas.
[1] 2050 represent the decommissioning phase of the Project.
See Attachment A for complete results. <0.01 = less than 0.005

As shown in Table 2, the estimated total GHG emissions during construction and decommissioning of the Project including SCE improvements would be approximately 957 MT CO_2e. Estimated Project-generated construction and decommissioning emissions including SCE improvements amortized over 30 years would be approximately 32 MT CO_2e per year.

Operational Emissions

CalEEMod was used to estimate potential Project-generated operational GHG emissions from energy (electricity), mobile, and offroad sources, and conservatively solid waste and water supply sources. Emissions from each category are discussed in the following text with respect to the Project. For additional details, see Section 2.2 for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (electricity), mobile, offroad, solid waste, stationary, and water supply sources. Operational year 2027 was assumed as the first year of operation. Table 3 presents the GHG emissions of the existing site and Project during operation including SCE improvements.

Table 3. Estimated Annual Operation GHG Emissions

Emissions Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Project				
Area	0.02	<0.01	<0.01	27.12
Energy	756.58	0.07	0.01	760.99
Mobile	1.40	<0.01	<0.01	1.42
Offroad	0.45	<0.01	<0.01	0.45
Stationary	41.73	<0.01	<0.01	41.87

Refrigerants	0.00	0.00	0.00	1.29
Waste	3.32	0.33	0.00	11.61
Water	9.71	0.23	0.01	16.99
			Total	**373.03**
			Net (Project minus Existing Site)	**488.16**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Attachment A for complete results. <0.01 = less than 0.005

As shown in Table 3, the estimated total GHG emissions during operation of the Project including SCE improvements would be approximately 861 MT CO_2e per year, including amortized construction and decommissioning emissions. The net emissions (Project minus Existing Site) would be 488 MT CO_2e per year. The Project including SCE improvements would not exceed the SCAQMD bright-line threshold of 3,000 MT CO_2e per year. Therefore, impacts would be less than significant.

b) Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Consistency with CARB's Scoping Plan

The Scoping Plan, approved by CARB in 2008 and updated in 2014, 2017, and 2022 provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. As such, the Scoping Plan is not directly applicable to specific projects, nor is it intended to be used for project-level evaluations.[7] Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low-Carbon Fuel Standard), among others. The Project would comply with all applicable regulations adopted in furtherance of the Scoping Plan to the extent required by law.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32 and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. Table 9 highlights measures that have been developed under the Scoping Plan and the Project's consistency with those measures. Table 4 also includes measures recommended in the Scoping Plan. To the extent that these regulations

[7] The Final Statement of Reasons for the amendments to the CEQA Guidelines reiterates the statement in the Initial Statement of Reasons that "[t]he Scoping Plan may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (CNRA 2009).

are applicable to the Project, its inhabitants, or uses, the Project including SCE improvements would comply with all applicable regulations adopted in furtherance of the Scoping Plan.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Transportation Sector		
Advanced Clean Cars	T-1	*Consistent.* The Project's employees would purchase vehicles in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase.
Low Carbon Fuel Standard	T-2	*Consistent.* Motor vehicles driven by the Project's employees would use compliant fuels.
Low Carbon Fuel Standard (18% reduction in carbon intensity by 2030)	Recommended	*Consistent.* Motor vehicles driven by the Project's employees would use compliant fuels.
Regional Transportation-Related GHG Targets	T-3	*Not applicable.* The Project would not prevent CARB from implementing this measure.
Advanced Clean Transit	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Last Mile Delivery	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Reduction in Vehicle Miles Traveled	Recommended	*Not applicable.* The Project would not prevent CARB from implementing this measure.
Vehicle Efficiency Measures 1. Tire Pressure 2. Fuel Efficiency Tire Program 3. Low-Friction Oil 4. Solar-Reflective Automotive Paint and Window Glazing	T-4	*Consistent.* These standards would be applicable to the light-duty vehicles that would access the Project site. Motor vehicles driven by the Project's employees would maintain proper tire pressure when their vehicles are serviced. The Project's employees would replace tires in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase. Motor vehicles driven by the Project's employees would use low-friction oils when their vehicles are serviced. The Project's employees would purchase vehicles in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase. In addition, the Project would not prevent CARB from implementing this measure.
Ship Electrification at Ports (Shore Power)	T-5	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Goods Movement Efficiency Measures 1. Port Drayage Trucks 2. Transport Refrigeration Units Cold Storage Prohibition 3. Cargo Handling Equipment, Anti-Idling, Hybrid, Electrification 4. Goods Movement Systemwide Efficiency Improvements 5. Commercial Harbor Craft Maintenance and Design Efficiency 6. Clean Ships 7. Vessel Speed Reduction	T-6	*Not applicable.* The Project would not prevent CARB from implementing this measure.
California Sustainable Freight Action Plan	Recommended	*Not applicable.* The Project would not prevent CARB from implementing this measure.
Heavy-Duty Vehicle GHG Emission Reduction 1. Tractor-Trailer GHG Regulation 2. Heavy-Duty Greenhouse Gas Standards for New Vehicle and Engines (Phase I)	T-7	*Consistent.* Heavy-duty vehicles would be required to comply with CARB GHG reduction measures. In addition, the Project would not prevent CARB from implementing this measure.
Medium- and Heavy-Duty Vehicle Hybridization Voucher Incentive project	T-8	*Consistent.* The Project medium- and heavy-duty vehicles (e.g., delivery trucks) during construction and operation could take advantage of the vehicle hybridization action, which would reduce GHG emissions through increased fuel efficiency. In addition, the Project would not prevent CARB from implementing this measure.
Medium and Heavy-Duty GHG Phase 2	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
High-Speed Rail	T-9	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Transportation Electrification	2022 Appendix D	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
VMT Reduction		
Is located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer)	2022 Appendix D	*Consistent.* The Project site is located on a developed parcel within the City. The Project site is surrounded by developed industrial parcels and is in close proximity to residential uses.
Does not result in the loss or conversion of natural and working lands	2022 Appendix D	*Consistent.* The Project site is located on a developed parcel within the City and would not result in the loss or conversion of natural and working land.
Consists of transit-supportive densities (minimum of 20 residential dwelling units per acre), or, Is in proximity to existing transit stops (within a half mile), or Satisfies more detailed and stringent criteria specified in the region's SCS.	2022 Appendix D	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Reduces parking requirements by: Eliminating parking requirements or including maximum allowable parking ratios (i.e., the ratio of parking spaces to residential units or square feet); or Providing residential parking supply at a ratio of less than one parking space per dwelling unit; or For multifamily residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit.	2022 Appendix D	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
At least 20 percent of units included are affordable to lower-income residents	2022 Appendix D	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Results in no net loss of existing affordable units	2022 Appendix D	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Uses all-electric appliances without any natural gas connections and does not use propane or other fossil fuels for space heating, water heating, or indoor cooking	2022 Appendix D	*Consistent.* There will be no natural gas used on-site.
Electricity and Natural Gas Sector		
Energy Efficiency Measures (Electricity)	E-1	*Consistent.* The Project will comply with current Title 24, Part 6, of the California Code of Regulations energy efficiency standards for electrical appliances and other devices at the time of building construction.
Energy Efficiency (Natural Gas)	CR-1	*Consistent.* The Project would be all-electric and would not use natural gas during operation.
Solar Water Heating (California Solar Initiative Thermal Program)	CR-2	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Combined Heat and Power	E-2	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Renewable Portfolios Standard (33% by 2020)	E-3	*Consistent.* While the Project supports this goal, the 2020 goal has passed and no longer applies.
Renewable Portfolios Standard (50% by 2050)	Recommended	*Consistent.* The Project would support the Renewable Portfolios Standard goal by helping integrate renewable energy to the electric grid and supporting grid reliability and resilience, thereby assisting the State to reach GHG emissions reduction targets.
Senate Bill 1 Million Solar Roofs (California Solar Initiative, New Solar Home Partnership, Public Utility Programs) and Earlier Solar Programs	E-4	*Not applicable.* The Project would not prevent CARB from implementing this measure.
Water Sector		
Water Use Efficiency	W-1	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Water Recycling	W-2	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Water System Energy Efficiency	W-3	*Not applicable.* This is applicable for the transmission and treatment of water, but it is not applicable for the Project.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Reuse Urban Runoff	W-4	*Not applicable.* The reuse of urban water on-site was determined to not be feasible. The Project would not prevent CARB from implementing this Scoping Plan Measure.
Renewable Energy Production	W-5	*Not applicable.* Applicable for wastewater treatment systems. Not applicable for the Project.
Green Buildings		
State Green Building Initiative: Leading the Way with State Buildings (Greening New and Existing State Buildings)	GB-1	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Green Building Standards Code (Greening New Public Schools, Residential and Commercial Buildings)	GB-2	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Beyond Code: Voluntary Programs at the Local Level (Greening New Public Schools, Residential and Commercial Buildings)	GB-3	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Greening Existing Buildings (Greening Existing Homes and Commercial Buildings)	GB-4	*Not applicable.* The Project would not prevent CARB from implementing this Scoping Plan Measure.
Industry Sector		
Energy Efficiency and Co-Benefits Audits for Large Industrial Sources	I-1	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Oil and Gas Extraction GHG Emission Reduction	I-2	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Reduce GHG Emissions by 20% in Oil Refinery Sector	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
GHG Emissions Reduction from Natural Gas Transmission and Distribution	I-3	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Refinery Flare Recovery Process Improvements	I-4	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Work with the local air districts to evaluate amendments to their existing leak detection and repair rules for industrial facilities to include methane leaks	I-5	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Recycling and Waste Management Sector		
Landfill Methane Control Measure	RW-1	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Increasing the Efficiency of Landfill Methane Capture	RW-2	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Mandatory Commercial Recycling	RW-3	*Consistent.* During both construction and operation, the Project would comply with all state regulations related to solid waste generation, storage, and disposal, including the California Integrated Waste Management Act, as amended. During construction, all wastes would be recycled to the maximum extent possible.
Increase Production and Markets for Compost and Other Organics	RW-4	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Anaerobic/Aerobic Digestion	RW-5	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Extended Producer Responsibility	RW-6	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Environmentally Preferable Purchasing	RW-7	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Forests Sector		
Sustainable Forest Target	F-1	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
High Global Warming Potential Gases Sector		
Motor Vehicle Air Conditioning Systems: Reduction of Refrigerant Emissions from Non-Professional Servicing	H-1	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
SF_6 Limits in Non-Utility and Non-Semiconductor Applications	H-2	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 4. Project Consistency with Scoping Plan GHG Emission-Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Reduction of Perfluorocarbons in Semiconductor Manufacturing	H-3	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Limit High Global Warming Potential Use in Consumer Products	H-4	*Consistent.* The Project's employees would use consumer products that would comply with the regulations that are in effect at the time of manufacture.
Air Conditioning Refrigerant Leak Test During Vehicle Smog Check	H-5	*Consistent.* Employees of the Project would conduct air conditioning refrigerant leak tests during periodic vehicle smog checks.
Stationary Equipment Refrigerant Management Program – Refrigerant Tracking/Reporting/Repair Program	H-6	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Stationary Equipment Refrigerant Management Program – Specifications for Commercial and Industrial Refrigeration	H-6	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
SF_6 Leak Reduction Gas Insulated Switchgear	H-6	*Consistent.* The Project would use gas insulated switchgear that would be subject to CARB regulations and meet the leak rate mandates.
40% reduction in methane and hydrofluorocarbon emissions	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
50% reduction in black carbon emissions	Recommended	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Agriculture Sector		
Methane Capture at Large Dairies	A-1	*Not applicable.* This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Consistency Evaluation with Senate Bill 375 (Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy)

SCAG updates the RTP/SCS every 4 years. The currently adopted RTP/SCS is the 2024–2050 RTP/SCS, also known as Connect SoCal 2024 (SCAG 2024). The 2024–2050 RTP/SCS identifies the following strategy areas to support its environmental goals: Sustainable Development, Air Quality, Clean Transportation, Natural and Agricultural Lands Preservation, and Climate Resilience. An analysis of the Project's compliance with the applicable strategies is presented below.

- **Sustainable Development.** The 2024–2050 RTP/SCS identifies sustainable development, including water and energy-efficient building practices and green infrastructure, as a strategy to reduce GHG emissions. Landscaping would use water-saving native plantings and contribute to passive cooling strategies. The Project would support the continued development of renewable energy sources. The Project would be remotely managed and would not result in an increase in daily operational mobile trips.

- **Air Quality.** The 2024–2050 RTP/SCS identifies air quality and meeting federal and state ambient air quality standards as a co-benefit of reducing GHG emissions. The Project would not exceed the SCAQMD's threshold of significance for any criteria air pollutant and would not result in any significant impacts related to air quality.
- **Clean Transportation.** The 2024–2050 RTP/SCS identifies electric vehicle charging infrastructure, adoption of zero-emission vehicles, and clean transit as ways to reduce GHG emissions from mobile sources. The Project would not increase traffic in the area during operation as it will be remotely managed and only require periodic maintenance visits.
- **Natural and Agricultural Lands Preservation.** The 2024–2050 RTP/SCS promotes the conservation and restoration of natural and agricultural lands through several policies, such as quantifying the carbon sequestration potential of natural and agricultural lands and prioritization of sensitive habitat and wildlife corridors for permanent protection. The Project would be located on an existing developed site and not on natural or agricultural lands.
- **Climate Resilience:** The 2024–2050 RTP/SCS promotes regional coordination and solutions for effective emergency response for climate-related hazards. Additionally, in the category of climate resilience, SCAG has established the following policies: prioritize the most vulnerable populations and communities subject to climate hazards; support local and regional climate and hazard planning; support nature-based solutions to increase regional resilience; promote sustainable water use planning; and, support an integrated planning approach to help jurisdictions meet housing needs in a drier environment. While it does not directly pertain to these climate resilience efforts, the Project would not conflict with these policies. The Project would repurpose existing developed land, which is generally considered more efficient and sustainable than new construction.

Based on the analysis above, the Project including SCE improvements would be consistent with the Connect SoCal 2024.

As discussed above, the Project including SCE improvements would be consistent with applicable GHG reduction measures found within the Scoping Plan and AB 32 and the SCAG Connect SoCal. Therefore, the Project including SCE improvements would not conflict with an applicable GHG reduction plan and impacts would be considered less than significant.

The Project including SCE improvements would not impede the attainment of the GHG reduction goals for 2030 or 2050 identified in Executive Order (EO) S-03-05, SB 32, and AB 1279. EO S-03-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes for a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. AB 1279 requires GHG emissions be reduced to 85% below 1990 levels by 2045. In addition, AB 1279 requires the

state to achieve net zero GHG emissions by no later than 2045 and achieve and maintain net negative GHG emissions thereafter.

While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasts that compliance with the current Scoping Plan puts the state on a trajectory toward meeting these long-term GHG goals, although the specific path to compliance is unknown (CARB 2014).

As discussed previously, the Project including SCE improvements is consistent with the GHG emission reduction measures in the Scoping Plan and would not conflict with the state's trajectory toward future GHG reductions. The Project would help integrate renewable energy to the electric grid and support grid reliability and resilience, thereby assisting the State and the City to reach greenhouse gas emissions reduction goals. The Project's compliance with applicable Scoping Plan strategies and Connect SoCal 2024 measures would assist in meeting the City's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32, EO S-03-05, and AB 1279, Based on the considerations previously outlined, the Project including SCE improvements would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and no mitigation is required. Therefore, the Project's impact including SCE improvements associated with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs would be less than significant.

4 Conclusions

The Project including SCE improvements would not exceed the SCAQMD bright-line significance threshold of 3,000 MT CO_2e per year. The Project including SCE improvements would also not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs as there are currently no mandatory GHG regulations or finalized agency guidelines that would apply to implementation of this Project. Accordingly, potential cumulative GHG impacts would be less than significant. As such, the Project including SCE improvements would not result in significant impacts to GHG emissions.

Sincerely,

Adam Poll, QEP, LEED AP BD+C
Senior Air Quality Specialist

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.4	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	78.0
AQ-PM	79.9
AQ-DPM	32.2
Drinking Water	96.7
Lead Risk Housing	60.5
Pesticides	0.00
Toxic Releases	70.6
Traffic	34.4
Effect Indicators	—
CleanUp Sites	59.6
Groundwater	17.5
Haz Waste Facilities/Generators	65.2
Impaired Water Bodies	0.00
Solid Waste	75.7
Sensitive Population	—
Asthma	48.1

Cardio-vascular	37.3
Low Birth Weights	41.7
Socioeconomic Factor Indicators	—
Education	62.5
Housing	66.1
Linguistic	37.0
Poverty	44.9
Unemployment	77.8

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	68.66418581
Employed	84.28076479
Median HI	66.62389324
Education	—
Bachelor's or higher	46.81124086
High school enrollment	100
Preschool enrollment	87.91222892
Transportation	—
Auto Access	58.83485179
Active commuting	45.8488387
Social	—
2-parent households	72.92441935
Voting	23.46978057
Neighborhood	—
Alcohol availability	30.98934942

Park access	52.70114205
Retail density	83.24137046
Supermarket access	86.15424099
Tree canopy	18.13165661
Housing	—
Homeownership	67.43231105
Housing habitability	68.0354164
Low-inc homeowner severe housing cost burden	68.00975234
Low-inc renter severe housing cost burden	28.6154241
Uncrowded housing	65.16104196
Health Outcomes	—
Insured adults	85.29449506
Arthritis	0.0
Asthma ER Admissions	56.3
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	35.4
Cognitively Disabled	64.4
Physically Disabled	41.1
Heart Attack ER Admissions	65.8
Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0
Pedestrian Injuries	19.6

Physical Health Not Good	0.0
Stroke	0.0
Health Risk Behaviors	—
Binge Drinking	0.0
Current Smoker	0.0
No Leisure Time for Physical Activity	0.0
Climate Change Exposures	—

2016 Voting	30.6

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	71.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Based on applicant provided information.
Construction: Off-Road Equipment	Based on applicant provided information.
Construction: Trips and VMT	Based on applicant provided information.
Operations: Energy Use	Energy for auxiliary use.
Operations: Water and Waste Water	No indoor water use.
Operations: Refrigerants	SF6 emissions estimated outside of CalEEMod.
Operations: Off-Road Equipment	One crane used to move containers every few years.
Operations: Emergency Generators and Fire Pumps	100% load assumed.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.4	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	78.0
AQ-PM	79.9
AQ-DPM	32.2
Drinking Water	96.7
Lead Risk Housing	60.5
Pesticides	0.00
Toxic Releases	70.6
Traffic	34.4
Effect Indicators	—
CleanUp Sites	59.6

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	71.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

1 Executive Summary

Dudek conducted a Phase I Environmental Site Assessment (ESA) for approximately 1.3 acres of land located in Covina, Los Angeles County, California (subject property; see Figure 1, Subject Property Location). The subject property is located on Assessor's Parcel Numbers (APNs) 8429-008-028 and 8429-008-029.

The findings of this investigation are based on historical sources, information contained in regulatory agency databases, interviews, and a site reconnaissance.

Information gathered for this report indicated the following:

- The subject property was used for agricultural purposes (orchards) as early as 1928 until sometime before 1954. Historical and agricultural use is generally associated with the use of pesticides and herbicides, which can result in elevated concentrations of chlorinated compounds and metals. However, since the site was graded and redeveloped by 1964, residual chlorinated compounds and metals, if present, were disturbed and redistributed and are therefore unlikely to impact the environmental conditions of the subject property.
- The subject property buildings were constructed in 1958 and 1960 as multi-tenant commercial properties.
- Adjacent properties include commercial/industrial properties, and nearby properties include a mix of residential housing and commercial/industrial properties.

This assessment did not reveal evidence of recognized environmental conditions (RECs), historical RECs (HRECs), controlled RECs (CRECs), or vapor encroachment conditions (VECs) (significant data gaps are discussed in Section 13.1, Data Gaps and Data Failures).

Dudek performed this Phase I ESA of the subject property in conformance with the scope and limitations of ASTM Standard E1527-21, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. This report summarizes the research and findings of the Phase I ESA data gaps, which were determined not to be significant and are discussed in Section 13.1.

Subject Property Location

522 and 534 East Edna Place, Covina, Los Angeles County, California - Phase I Environmental Site Assessment

2 Introduction

This Phase I Environmental Site Assessment (ESA) was performed according to the guidelines stipulated in the ASTM Standard E1527-21, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM 2021). This Phase I ESA is being conducted on behalf of Upstream, as part of environmental due diligence prior to acquiring the subject property. As defined in Section 3.2.94 of ASTM Standard E1527-21, the user is defined as the party seeking to complete the Phase I ESA on the subject property. User obligations, as defined in ASTM Standard E1527-21, are discussed further in Section 6.2, User-Provided Information.

2.1 Assessment Procedure and Scope of Investigation

Phase I ESAs assist in identifying past and present land use, including identification of possible releases or disposal of manufacturing or other wastes if such information is contained within regulatory reports or files and/or is currently visible on site. The assessment reviews federal (U.S. Environmental Protection Agency), state, county, and local lists of known or potentially hazardous waste sites, landfills, and sites currently under investigation for environmental violations that may be of concern to a site.

The scope of this environmental investigation consisted of (1) a reconnaissance of the subject property; (2) a search of regulatory agency records; (3) a review of available historical aerial photographs, topographic maps, Sanborn fire insurance maps, city directory listings, and building department records; (4) an environmental lien and activity and use limitation (AUL) search; (5) interviews with the owner of the subject property and user of this report; and (6) preparation of this Phase I ESA report detailing the findings of the investigation.

These activities were conducted to identify RECs. The term *recognized environmental condition* (REC) means the presence or likely presence of any hazardous substances or petroleum products in, on, or at the subject property due to a release, likely release, past release, or material threat of a future release to the environment.

The term *controlled recognized environmental condition* (CREC) is an environmental condition that would have been considered a REC in the past but that has been remediated and received risk-based closure by a regulatory agency (i.e., received a "No Further Action" letter) where residual contamination remains in place. Furthermore, the term *CREC* is used if the property is subject to a control or use restriction (i.e., property use restrictions, AULs, institutional controls, or engineering controls) due to residual on-site contamination.

The term *historical recognized environmental condition* (HREC) is an environmental condition that would have been considered a REC in the past but that has been remediated and received unrestricted residential use closure by the regulatory agency. Therefore, no controls or use restrictions have been applied to the property.

The term *REC* is not intended to include de minimis conditions. De minimis conditions are conditions that generally do not present a material risk of harm to public health or the environment and thus would not be subject to an enforcement action if brought to the attention of governmental agencies.

2.2 Qualifications of Environmental Professionals

This Phase I ESA was prepared by Susan Smith, geologist, and Stephanie Chao, environmental engineer. Qualifications for Ms. Smith and Ms. Chao are included in Appendix A.

I, Susan Smith, declare that, to the best of my professional knowledge and belief, I meet the definition of environmental professional as defined in Section 312.10 of 40 Code of Federal Regulations Part 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 Code of Federal Regulations Part 312.

3 Site Location

The subject property is located east of the southeast corner of the intersection of East Edna Place and Barranca Avenue in Covina, Los Angeles County, California. The subject property consists of approximately 1.3 acres of land located on two contiguous parcels (Assessor's Parcel Numbers [APNs] 8429-008-028 and 8429-008-029). Two addresses, 522 and 534 East Edna Place, are associated with the subject property.

The subject property is currently developed with two multi-tenant commercial buildings and an associated parking lot. The subject property is approximately 1.39 miles north of the Interstate 10 and approximately 1.55 miles east of California State Route 39 (Azusa Avenue) in the City of Covina in southeastern Los Angeles County.

The subject property is adjoined by commercial properties to the north and west, by train tracks to the south, and by a substation to the west. Surrounding properties consist of commercial properties, single- and multi-family residential properties, an adult school, and a community park.

4 Environmental Setting

4.1 Topography and Geology

General topographic information for the subject property and the surrounding area was obtained from a review of topographic maps (Appendix B), the Environmental Data Resources (EDR) Radius Map Report (Appendix C), and a site visit. The natural topography of the subject property is relatively flat with an overall gentle downward slope toward the west/southwest. The subject property sits at an average elevation of 595 feet above mean sea level.

No subsurface geologic investigations were performed as part of this Phase I ESA. According to the EDR Radius Map Report (Appendix C), the subject property is primarily underlain by URBAN LAND soil components. These soil components and characteristics are not well defined; drainage and infiltration rates are not available.

4.2 Groundwater

According to the EDR Radius Map Report (Appendix C), there are nine water wells located within 1 mile of the subject property, none of which are depicted on the subject property. Of the nine wells, one is listed as a Federal U.S. Geological Survey monitoring well, one as a Federal Public Water Supply well, one is listed as an abandoned City Hall well, one is listed as an inactive well on Grand Avenue, and three are listed with unknown uses; no uses were identified for the remaining 2 wells. Dudek reviewed information on the California Water Boards Groundwater Information System and did not identify any wells located on the subject property; one water supply well was located approximately 0.35 miles east of the subject property (GAMA 2023). Dudek also reviewed nearby monitoring sites on GeoTracker to obtain information about groundwater near the subject property. A site located 1,000 feet west of the subject property (Robert's Holiday Lines) reported a depth to water of 308.4 feet in 1990 (Aman Environmental, Inc. 1991).

4.3 Agricultural Use

Historical resources (see Section 8, Site History) indicate the subject property was developed with orchards from at least 1928 through 1948, before the land was cleared and commercial development occurred on the subject property. Soils were likely disturbed during commercial development of the subject property, which occurred prior to 1958 when the first building was constructed on the subject property.

As with all agricultural properties, pesticides and herbicides are likely used. The chemicals of concern associated with these compounds, such as organochlorinated compounds and metals, accumulate and persistent in shallow soils. Therefore, the longer a property is used for agricultural purposes, the more likely there is an accumulation of these chemicals of concern. While the subject property was used for agricultural purposes from the 1920s through the 1940s, it was redeveloped in 1958 for commercial properties, including grading and excavation for construction of the existing buildings. Surface soils were likely removed during construction activities; therefore, concentrations of any residual pesticide- and herbicide-related compounds are likely low. Therefore, it is unlikely the historical agricultural use is a REC.

5 Regulatory Agency Records Search Review

The regulatory database search gives a listing of sites within up to a 1-mile radius of the subject property ("target property" is the term used by EDR) that are known to be chemical handlers or hazardous waste generators or have reported releases of hazardous substances or petroleum products. Information in these listings includes the location of the site relative to the subject property, type of potential environmental concern present, and the status of the site. On June 16, 2023, EDR provided the database search for this Phase I ESA.

Table 1 summarizes the environmental databases that were searched as required by ASTM E1527-21, as well as additional environmental databases providing information on hazardous materials and petroleum products on the subject property that were searched. The comprehensive list of databases is included in the EDR Radius Map Report (Appendix C).

Table 1. Regulatory Database Search Summary

Acronym	Database	Search Distance*	Subject Property Listed?	Number of Surrounding Sites Listed

Note:
* The search distances in the EDR Radius Map Report and listed in this table are equal to or greater than the search distances required by ASTM Standard E1527-21.

5.1 Subject Property

The subject property was identified under the following names: LA Framing Wholesaler (534 East Edna Place), Condal Precision Machine (526 ½ East Edna Place), Southern California Edison (540 East Edna Place), Western Meter Exchange (532 Edna Place), Winter Engineering (530A East Edna Place), ACP Tag & Labels (538 East Edna Place), and BW Precision Inc. (526 ½ Edna Place). Discussions about the database listings for each of the subject property listings are presented below.

- LA Framing Wholesaler (534 East Edna Place) was listed in the Los Angeles Co. HMS database. The Los Angeles Co. HMS database provides information about active and inactive hazardous materials facilities in Los Angeles; the site is listed as "open." This listing is not indicative of a spill or release of hazardous materials and is administrative in nature; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- Condal Precision Machine (526 ½ East Edna Place) was listed in the Los Angeles Co. HMS database. The Los Angeles Co. HMS database provides information about active and inactive hazardous materials facilities in Los Angeles; the site is listed as "open." This listing is not indicative of a spill or release of hazardous materials and is administrative in nature; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- Southern California Edison (540 East Edna Place) was listed in the HAZNET and HWTS databases. These databases present information about facilities, generator identification numbers, waste manifests, and other administrative information. These listings are administrative in nature and no spills or releases were reported; therefore, this site is unlikely to impact the environmental conditions of the subject property.
- Western Meter Exchange (532 Edna Place) was listed in the HAZNET, HWTS, RCRA-SQG, FINDS, and ECHO databases. These databases present information about facilities, generator identification numbers, waste manifests, enforcement and compliance, and other administrative information. These listings are administrative in nature and no spills, releases, or violations were reported; therefore, this site is unlikely to impact to the environmental conditions of the subject property.
- Winter Engineering (530A East Edna Place), also listed as Decorator's Concept Builders, was listed in the Los Angeles Co. HMS, NPDES, CIWQS, and CERS databases. These databases present information about facilities, permits, and other administrative information. These listings are administrative in nature and no spills or releases were reported; therefore, this site is unlikely to impact the environmental conditions of the subject property.
- ACP Tag & Labels (538 East Edna Place) was listed in the Los Angeles Co. HMS database. The Los Angeles Co. HMS database provides information about active and inactive hazardous materials facilities in Los Angeles; the site is listed as "open." This listing is not indicative of a spill or release of hazardous materials and is administrative in nature; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- BW Precision Inc. (526 ½ Edna Place) was listed in the HAZNET and HWTS databases. These databases present information about facilities, generator identification numbers, waste manifests, and other administrative information. These listings are administrative in nature and no spills or releases were reported; therefore, this site is unlikely to impact the environmental conditions of the subject property.

5.2 Adjoining and Nearby Properties

A total of 159 listings with 78 unique addresses were identified within 1 mile of the subject property. Of those, 18 unique sites were identified as adjoining the subject property and/or have a regulatory file that indicates a release of hazardous substances or petroleum products to the environment with the potential to impact the subject property. For these sites, the site name, address, database listings, relative location (approximate distance and direction) as measured from the nearest edge of the subject property, and discussion of the site status are included in Table 2. Potential impacts to the subject property are based on distance from the subject property, known groundwater gradients, and status of the regulatory listing provided. Information presented in Table 2 was gathered

from the EDR Radius Map Report and from documents available for review on GeoTracker (SWRCB 2023) and EnviroStor (DTSC 2023).

The remaining listings are administrative in nature and do not necessarily represent a release of hazardous materials or petroleum products to the environment or are at such distance from the subject property, are downgradient relative to the subject property, and/or have contamination contained to soil media and that they are not likely to impact the subject property. Therefore, the sites not listed in the table are not likely to have impacted the environmental conditions of the subject property.

Table 2. Evaluation of Nearby Sites

Site Name and Address	Database Listings	Relative Location with Respect to Subject Property	Case Status	Flow Direction and Relative Gradient to SP
Adjoining Properties				
Eldon Draper Cleaners (also reported as "Eldon Dry Cleaners [Former], "Eldon Dry Cleaners, Samanta Tai," and "Eldon Dry Cleaners, F.X. Zacharias") 551 East Edna Place	ENVIROSTOR, RCRA-SQG, FINDS, ECHO, DRYCLEANERS, EDR HIST CLEANER	Adjoining to the north	Not applicable	South/southwest, upgradient
A drycleaner was in operation at this site from at least 1991 to 1999. The site is listed for having been a small-quantity generator that historically used tetrachloroethylene. No violations or evaluations were identified for the site. Due to the proximity to the subject property and the upgradient direction relative to the subject property, this site may impact the environmental conditions of the subject property and is therefore considered a REC.				
City of Covina Field Operation Yard (also reported as "City of Covina Corp. Yard," "City Yard," "City of Covina," and "LA County Sanitation Districts/Covina City Yard") 534 North Barranca Avenue	RCRA NONGEN/ NLR, HWTS, LUST, SWEEPS UST, HIST UST, CORTESE, EMI, HAZNET, CERS, CERZ HAZ WASTE, CERS TANKS, UST, AST, LOS ANGELES CO. HMS	Adjoining to the south	Completed – Case closed as of September 2005	South/southwest, crossgradient
This site is a former leaking underground storage tank cleanup site that had diesel-contaminated soil. Soil analysis data from the Q3 2003 Report on Underground Storage Tank Removal/Replacement (GeoTracker 2023) did not detect any contaminants of concern above laboratory reporting limits. Given the lack of reportable levels of contamination and contamination confined to soil media, it is unlikely that this site has impacted the environmental conditions of the subject property.				

5.3 Unmapped Sites

Unmapped sites are flagged by EDR but not mapped due to insufficient address information. They are usually included in the database search report because they are in the same zip code as the subject property. The EDR Radius Map Report identified two unmapped sites. Dudek reviewed the sites and determined that one location, Glendora City Dump #247, is listed in the SWF/LF (SWIS: Solid Waste Information System) database and is located more than 3 miles northeast of the subject property. This site is closed and was used as an inert landfill with its current use being listed as vacant, industrial land. Based on the distance from the subject property, it is unlikely that this site has impacted the environmental conditions of the subject property. The other site, Covina Substation, is listed in the CPS-SLIC (Cleanup Program Site – Spills, Leaks, Investigations, and Cleanups) database and is located approximately 0.49 miles southwest of the subject property. This site is a completed/case closed site as of October 2022 with potential arsenic- and total petroleum hydrocarbons-contaminated soil present at the site. Based on the impacted media at this site (soil only) and regulatory case status (closed), it is unlikely that this site has impacted the environmental conditions of the subject property.

6 Interviews

6.1 Site Representative Interview

On June 20, 2023, Joshua Bory, owner of the subject property, completed a site background questionnaire. A copy of the questionnaire is presented in Appendix D. Below is the summary of the responses to the questionnaire.

- Mr. Bory has owned the property since August 1984.
- The subject property is currently used as rental units for commercial use (e.g., personal storage, personal hobby shops, and light commercial business use).
- The subject property has been used for these purposes for 65 years.
- Buildings on the property consist of single-story, concrete block buildings on a cement foundation, constructed in 1958.
- The property has been used as industrial rentals since it was constructed.
- The previous owner of the property was Edwin Begin (deceased).
- The subject property and adjoining properties have not been used as a gas station, printing facility, metal plating manufacturing, landfill, auto repair/service facility, dry cleaner, junkyard/auto dismantling, waste treatment, or other industrial use.
- The subject property has not been used for agricultural purposes, as a dump/burn area, or for hazardous substances storage.
- The representative was not aware of any previous hazardous materials use, storage, or other activities on the subject property that could indicate a release of hazardous materials or petroleum products.

6.2 User-Provided Information

In accordance with ASTM Standard E1527-21 (ASTM 2021), to qualify for one of the Landowner Liability Protections offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001, the tasks outlined in Section 6.2 through 6.6 of ASTM Standard E1527-21 must be completed, including a search for environmental liens and AULs. To facilitate this requirement, Dudek sent the following questions to the user of this report. Answers to these questions fulfill the requirement of Sections 6.2 through 6.6 of the ASTM Standard. Dudek sent the following questions to the user of this report. Max Margolin, Director of Development at Upstream, provided the following responses on June 20, 2023.

1. **Question:** Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state, or local law?

   No.

2. **Question:** Are you aware of any activity and land use limitations, such as engineering controls, land use restrictions, or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state, or local law?

   No.

3. **Question:** As the user of this ESA, do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

   No.

4. **Question:** Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

   N/A.

5. **Question:** Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases?

   No.

   a. Do you know the past uses of the property? Light industrial buildings with numerous tenants.
   b. Do you know of specific chemicals that are present or once were present at the property? No.
   c. Do you know of spills or other chemical releases that have taken place at the property? No.
   d. Do you know of any environmental cleanups that have taken place at the property? No.

6. **Question:** As the user of this ESA, based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?

   No.

6.3 Local Agency Records

6.3.1 County of Los Angeles

6.3.1.1 Fire Department

Dudek reviewed the Los Angeles County Fire Department (LACoFD) online Certified Unified Program Agency lists (LACoFD 2023) for information about the subject property. The LACoFD Health Hazardous Materials Division acts as Los Angeles County's Certified Unified Program Agency and as a local oversight regulatory program maintaining information about potential spills, cleanups, tanks, or chemical use that may have impacted the environmental conditions of the subject property. The subject property was identified in one of the Health Hazardous Materials Division databases searched. Don's Off Road 4x4, located at the historical subject property address, 532 East Edna Place, was listed in the Inactive Facility Inventory (Appendix E).

Dudek submitted requests to LACoFD for files pertaining to the subject property on June 16, 2023. A response was received on June 26, 2023, that no records were identified for the subject property addresses.

6.3.1.2 Office of the Assessor

Zoning information for the subject property was obtained from the Los Angeles County Office of the Assessor Property Assessment Information System. The subject property type is listed as commercial/industrial with one approximately 16,800-square-foot building constructed in 1960 at 522 East Edna Place, and one approximately 15,840-square-foot building constructed in 1958 at 534 East Edna Place (Los Angeles County 2023).

6.3.1.3 Department of Public Works

Dudek contacted the Los Angeles County Department of Public Works on June 16, 2023, to obtain files relating to any underground storage tanks. A response was received on June 20, 2023, that no records were identified for the subject property addresses. Dudek also submitted a request on July 10, 2023, for records and permit information pertaining to the subject property. A response was received on July 11, 2023, with two inspection records from November 2000 and February 2001 for 534 East Edna Place, identified as L A Framing Wholesaler. The inspection records indicate that the site best management practices were used and effective (Appendix E).

6.3.1.4 Agricultural Commissioner/Weights & Measures

Dudek contacted the Los Angeles County Agricultural Commissioner/Weights & Measures Department on July 10, 2023, to obtain files relating to historical pesticide and herbicide use as it pertains to the subject property. As of the date of this report, no response has been received.

6.3.2 City of Covina

6.3.2.1 Planning Division

Dudek contacted the City of Covina's Planning Division on July 10, 2023, to obtain files relating to building records, inspection records, permits, and/or code violations as it pertains to the subject property. As of the date of this report, no response has been received.

6.3.2.2 City Clerk

Dudek contacted the City of Covina's City Clerk on July 10, 2023, to obtain files relating to building records, inspection records, permits, and/or code violations as it pertains to the subject property. As of the date of this report, no response has been received.

6.3.3 California Department of Resources Recycling and Recovery Solid Waste Information System

Dudek reviewed the California Department of Resources Recycling and Recovery Solid Waste Information System online database (CalRecycle 2023). The database has information for all solid waste facilities, operation, and disposal sites in California. No sites were identified on the subject property. No sites were identified within 1 mile of the subject property.

6.3.4 State Water Resources Control Board

Dudek searched GeoTracker, the State Water Resources Control Board's data management system, for sites that impact, or have the potential to impact, water quality in California. Records include sites that require cleanup, various unregulated projects, and permitted facilities (SWRCB 2023). The subject property was not identified in the database. Seventeen sites were identified within 0.5 miles of the subject property. All these sites were at a given distance from the subject property, downgradient relative to the subject property, had contamination contained to soil media, and/or matched sites listed in the EDR Radius Map Report (discussed in Section 5.2, Adjoining and Nearby Properties); therefore, it would be unlikely that any of those sites have impacted the environmental conditions of the subject property.

Dudek also requested records from the Los Angeles Regional Water Quality Control Board on July 11, 2023, pertaining to the subject property. As of the date of this report, no response has been received.

6.3.5 Department of Toxic Substances Control

Dudek searched the EnviroStor database management system used for tracking cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known contamination (DTSC 2023). The subject property was not identified in the database. Five sites were identified within 1 mile of the subject property. Of the five sites, two are tiered permit sites, one is an evaluation site, and two are voluntary cleanup sites. Of the two voluntary cleanup sites, one is approximately 0.72 miles west and downgradient of the subject property; therefore, the site is not considered close enough to potentially impact the subject property. The other voluntary cleanup site, Vita Pakt – Area 1, does not have contamination considered likely impactful to the environmental conditions of the subject property, due to the contamination contained to soil and soil vapor, and its distance relative to the subject property.

6.3.6 California Environmental Protection Agency Regulated Site Portal

Dudek reviewed the California Environmental Protection Agency Regulated Site Portal, which contains data about environmentally regulated sites and facilities in California (CalEPA 2023). Data sources for the portal include the California Environmental Reporting System, the Department of Toxic Substances Control EnviroStor, the State Water Resources Control Board GeoTracker, the California Integrated Water Quality System, and the Federal Toxics Release Inventory.

California Environmental Protection Agency sites are generally administrative in nature, identifying sites that have environmental permits or that handle hazardous materials or generate hazardous waste, but that do not necessarily have an uncontrolled release of hazardous substances to the environment. Two sites were identified on the subject property.

- Terra Furniture was identified on the subject property at the address 549 East Edna Place. The site is listed as a chemical storage facility that stores propane and argon mixed with carbon dioxide. The site has had a single violation that was returned to compliance for failure to complete and electronically submit a Hazardous Materials Release Response Plan. Due to the administrative nature of the database listing and single violation, it is unlikely this listing has impacted the environmental conditions of the subject property.

- Winter Engineering was identified on the subject property at the address 530A East Edna Place. The site is listed as an industrial stormwater facility. This site listing is administrative in nature and is not indicative of a release or spill of hazardous materials; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.

Five sites were identified adjoining the subject property.

- SHS Honda & Acura Service, located at 650 North Barranca Avenue, Suite B, is adjoining to the west of the subject property and is listed as a chemical storage facility and hazardous waste generator. The site has had multiple violations that were administrative in nature and not indicative of a release or spill of hazardous materials; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- Covina Smog, located at 650 North Barranca Avenue, Unit C, is adjoining to the west of the subject property and is listed as a chemical storage facility and hazardous waste generator. The site has had multiple violations that were administrative in nature and not indicative of a release or spill of hazardous materials; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- SMHE, located at 525 East Edna Place, is adjoining to the north of the subject property and is listed as an industrial stormwater facility. This site has had one violation that was administrative in nature, therefore it is unlikely that this site has impacted the environmental conditions of the subject property.
- SCE Cortez Substation, located at 560 East Edna Place, is adjoining to the east of the subject property and is listed as a chemical storage facility with no violations. This site listing is administrative in nature and not indicative of a release or spill of hazardous materials; therefore, it is unlikely this site has impacted the environmental conditions of the subject property.
- City of Covina, located at 534 North Barranca Avenue, is adjoining to the south of the subject property and is listed as a chemical storage facility, hazardous waste generator, and aboveground petroleum storage facility. The site has had multiple violations that were administrative in nature or did not indicate an uncontrolled spill or release of hazardous materials to the environment; therefore, it is unlikely that this site has impacted the environmental conditions of the subject property.

6.3.7 California Geologic Energy Management Division

Dudek reviewed the California Geologic Energy Management Division database on July 11, 2023 (CalGEM 2023). No oil or gas wells were identified on the subject property. The nearest oil and gas well is approximately 0.84 miles to the northeast of the subject property. Two wells are mapped within 1 mile of the subject property. Both wells are identified as plugged, dry-hole oil and/or gas wells.

6.3.8 National Pipeline Mapping System

Dudek searched the National Pipeline Mapping System online database, which provides a public map viewer application that displays data related to gas transmission and hazardous liquid pipelines, liquefied natural gas plants, and breakout tanks under the Department of Transportation Pipeline and Hazardous Material Safety Administration jurisdiction (NPMS 2023).

One gas transmission pipeline was identified approximately 0.04 miles west of the subject property. The pipeline is an active (filled) natural gas distribution pipeline operated by Southern California Gas Co. No hazardous liquid pipelines, accidents (liquid), or incidents (gas) were reported or identified within 1 mile of the subject property.

7 Site Reconnaissance

A site reconnaissance was conducted on June 22, 2023, by Stephanie Chao of Dudek. The site reconnaissance consisted of walking the subject property, taking notes on observations, and taking photographs. All interior spaces were not accessible during site reconnaissance. Photographs are presented in Appendix F. Ms. Chao was unaccompanied during the site reconnaissance.

7.1 Description of Subject Property and Surroundings

The subject property consists of two contiguous parcels that make up approximately 1.3 acres of land developed with two multi-tenant commercial buildings and an associated parking lot. The subject property is located south of East Edna Place. The subject property can be accessed from East Edna Place to the north (Photograph 1). Access to the individual tenant units was not available at the time of the site reconnaissance though the tenant businesses and uses were identified through an email from the site representative. In an email from the site representative, Max Margolin, at the time of site reconnaissance, the tenant spaces were occupied by the following:

- 522 and 524 East Edna Place – Band Recording Studio (Photograph 2)
- 526 East Edna Place – CMC Solutions (Computer Tech)
- 526 ½ East Edna Place – Tuff Skin Truck Beds
- 528 East Edna Place – Suazo's HVAC
- 528 ½ and 532 East Edna Place – AD Security
- 530 and 530A East Edna Place – Winter Engineering
- 530B East Edna Place – Personal Hobby Shop
- 532A and 532B East Edna Place – Josh Mason's Workshop
- 532A – RP Construction Storage
- 534 and 536 East Edna Place – Shabbyology Boutique (Photograph 3)
- 538 East Edna Place – Art Studio
- 540 and 542 East Edna Place – Garcia's Nets
- 544 East Edna Place – Personal Home Storage
- 546 East Edna Place – Personal Storage
- 548 East Edna Place – Personal Storage
- 550 East Edna Place – MPC Trading
- 550A East Edna Place – BBQ Pellet Storage
- 550B East Edna Place – Family Storage

During the site visit, only the outsides of the garages and tenant units was observed, along with the parking lot that separates the two commercial buildings (Photograph 4). Overhead powerlines were observed along the boundaries of the subject property; transformers were located on the eastern and southwestern powerline poles (Photographs 5 and 6). The subject property is adjoined to the west by commercial properties (Photograph 7), to the north by

multi-tenant commercial properties (Photograph 8), to the south by railroad tracks and additional commercial properties (Photograph 9), and to the east by the Cortez Substation (Photograph 10). Along the northern edge of the subject property, a manhole cover and utility box were observed (Photograph 11). Outside of some of the units were municipal trash receptacles (Photograph 12). Two mobile storage units were observed in the parking lot, along the southern edge of the subject property (Photograph 13). De minimis staining was observed throughout the parking lot (Photograph 14) with one stain approximately 3 feet by 3 feet (Photograph 15).

The main areas of interest noted during the site reconnaissance are described in the following section.

7.2 Summary of Observations

Potable Water Supply or Source

Municipal water shutoff valves were observed at staggered locations between some of the tenant units (Photograph 16).

Sewage Disposal System

A manhole cover was observed along the northern edge of the subject property boundary that potentially connects to an underground sewer system (Photograph 11).

Wetlands and Natural Waterways

No natural waterways or wetlands were observed on the subject property.

Surface Water Discharge

Surface water flows off the parking lot and toward the northern and southern boundaries of the subject property.

Distressed Vegetation

No distressed vegetation was observed on the subject property.

Solid Debris Storage

No solid debris disposal or storage was observed on the subject property.

Hazardous Material and Petroleum Product Use and Storage

No hazardous material or petroleum product storage or use was observed on the subject property.

Unnaturally Discolored Ponds or Flowing Waters

No unnaturally discolored pools or flowing water were observed on the subject property.

Groundwater Wells, Cisterns, Cesspools, or Septic Tanks

No groundwater wells, cisterns, cesspools, or septic tanks were observed on the subject property.

Polychlorinated Biphenyl-Containing Items

Seven pole-mounted transformers were observed along the eastern and western subject property boundaries. The transformers were not able to be observed as they were in a locked alleyway.

Sumps or Ponds

No sumps or ponds were observed on the subject property.

Abnormal Odor

No abnormal odors were noted on the subject property.

Surface Staining, Corrosion, and Soil Disturbances

Oil staining was observed on the paved parking lot portions of the subject property (Photographs 14 and 15).

Tanks, Drums, Totes, and Intermediate Bulk Containers

No tanks, drums, totes, or intermediate bulk containers were observed on the subject property during the site reconnaissance.

Agricultural Use

Based on a review of historical sources, the subject property was used for agricultural purposes from at least 1928 through 1948.

Off-Site Sources

No off-site sources were observed during site reconnaissance.

Fill Material

Fill material was not observed on the subject property.

Unidentified Substance Containers

No unidentified substance containers were observed on the subject property.

Pipelines

No hazardous material pipelines were observed on the subject property. A review of the National Pipeline Mapping System Public Viewer (NPMS 2023) identified one gas transmission pipeline located approximately 0.04 miles west of the subject property. This pipeline was reported as actively distributing natural gas. No access manholes were observed along the subject property during site reconnaissance.

8 Site History

Based on a review of the historical aerial photographs, historical topographic maps, agency records, and the city directory report, the subject property was developed for agricultural purposes sometime between 1928 and 1948. The land was then cleared and redeveloped to its current configuration as commercial development with associated parking beginning in 1958 when the first commercial structure was built on the subject property.

Gaps greater than the 5-year interval required by the ASTM Standard were identified in historical resources. This constitutes a data failure and is discussed further in Section 13, Limitations.

An east–west-trending railroad track has been adjoining to the south of the subject property from at least 1894 until the present. The northern-, eastern-, and western-adjoining properties were agriculturally developed from at least 1928 to 1948, before being cleared prior to 1958 for commercial development that occurred in 1958 and 1960. The eastern-adjoining property has been developed as a substation since at least 1964 to the present. The southern-adjoining properties were predominantly agriculturally developed from at least 1928 to 1938, before being cleared between 1938 and 1948 for commercial development that occurred between 1948 and 1954. Surrounding properties have been predominantly mixed-use residential and commercial/industrial development as early as 1954 with continued development up until the present.

8.1 Historical Aerial Photographs

Dudek reviewed historical aerial photographs obtained from EDR for 1928, 1938, 1948, 1954, 1964, 1970, 1977, 1983, 1989, 1990, 1995, 2005, 2009, 2012, 2016, and 2020 (Appendix G). Dudek also reviewed aerial photographs from Google Earth for 2023 (Google Earth 2023). The photographs provided background information to assess the possibility of past activities that could present environmental concerns. The aerial photographs are described in Table 3.

Table 3. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
1928	The subject property appears to consist entirely of orchard vegetation.	The adjoining areas to the north, east, and west appear to be orchards. A road is observed adjoining to the south of the subject property with orchards south of that road. A structure is observed on the southern-adjoining property. The greater surrounding areas appear to be predominantly orchards with some areas in the western, northern, and eastern surrounding areas. A reservoir is observed approximately 0.25 miles southeast of the subject property. A parcel of land in the western and northern surrounding areas appears to be cleared for development. Scattered structures are observed in the greater surrounding areas with a larger concentration of structures observed in the southwestern surrounding area.
1938	The subject property appears similar to the 1928 aerial photograph.	The adjoining properties appear similar to the 1928 aerial photograph. Additional structures and increased areas of agricultural land use are observed in the northern and eastern surrounding areas where the land had previously

Table 3. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
		been cleared. The rest of the surrounding areas appear similar to the 1928 aerial photograph.
1948	The orchard vegetation on the subject property appears less dense, particularly in the northern region, than in previous aerial photographs.	The southern-adjoining area has been cleared of orchard vegetation. The orchards on the northern-, eastern-, and western-adjoining areas appear to be less dense than in previous aerial photographs. Additional areas in the greater surrounding region, particularly to the west, have been cleared of their previous orchards with some residential-sized structures observed in the southwestern surrounding area. Multiple large structures are observed approximately 230 feet to the west of the subject property.
1954	The subject property has been cleared of any remaining orchard vegetation and now appears as a cleared parcel of land.	The adjoining areas to the north, east, and west have been cleared of any remaining orchards and now appear as cleared parcels of land. Development has occurred on the southern-adjoining property where various-sized structures are observed. Additional areas of cleared orchards are observed in the greater surrounding area. Residential development is observed in the northern, eastern, and western surrounding areas. Additional large structures and further development are observed in the western surrounding area.
1964	Two large commercial structures are observed on the eastern and western regions of the subject property with a parking lot observed between them.	A road where present-day Edna Place can be found is adjoining to the north of the subject property, with commercial/industrial development observed just north of that road. Commercial/industrial development is also observed on the eastern- and western-adjoining properties. The eastern-adjoining property appears to be developed as a substation. Almost all orchards have been removed in the greater surrounding areas where continued development is observed. An increased number of paved roads and residential development are observed in all the greater surrounding areas.
1970	The subject property appears similar to the 1964 aerial photograph.	The adjoining properties appear similar to the 1964 aerial photograph. Continued commercial/industrial development is observed in the eastern and western surrounding areas. The rest of the surrounding properties appear similar to the 1964 aerial photograph.
1977	The subject property appears similar to the 1970 aerial photograph.	The adjoining and surrounding properties appear similar to the 1970 aerial photograph.
1983	The subject property appears similar to the 1977 aerial photograph.	A large structure is observed on the southern-adjoining property where there was previously a portion of a parking lot. The rest of the adjoining properties appear similar to the 1977 aerial photograph. Scattered residential and commercial/industrial development is observed to be continuing in the greater surrounding areas.
1989	The subject property appears similar to the 1983 aerial photograph.	The adjoining and surrounding properties appear similar to the 1983 aerial photograph.
1990	The subject property appears similar to the 1989 aerial photograph.	The adjoining and surrounding properties appear similar to the 1989 aerial photograph.

Table 3. Summary of Aerial Photographs

Date	Subject Property	Adjoining and Surrounding Properties
1995	The subject property appears similar to the 1990 aerial photograph.	The adjoining and surrounding properties appear similar to the 1990 aerial photograph.
2005	The subject property appears similar to the 1995 aerial photograph.	A large commercial/industrial-sized structure is observed on the portion of the western-adjoining property that was previously a parking lot. An additional structure is observed on the southern-adjoining property. The rest of the adjoining properties appear similar to the 1995 aerial photograph. A new parking lot and an additional commercial/industrial-sized structure is observed in the northwestern surrounding area where previously there was a parking lot and empty lot. The rest of the surrounding properties appear similar to the 1995 aerial photograph.
2009	The subject property appears similar to the 2005 aerial photograph.	The adjoining and surrounding properties appear similar to the 2005 aerial photograph.
2012	The subject property appears similar to the 2009 aerial photograph.	The adjoining and surrounding properties appear similar to the 2009 aerial photograph.
2016	The subject property appears similar to the 2012 aerial photograph.	The adjoining and surrounding properties appear similar to the 2012 aerial photograph.
2020	The subject property appears similar to the 2016 aerial photograph.	Portions of the western-adjoining property have been extended farther east. The rest of the adjoining and surrounding properties appear similar to the 2016 aerial photograph. Continued commercial development is observed in the northeastern and northwestern surrounding area. The rest of the surrounding properties appear similar to the 2016 aerial photograph.
2023	The subject property appears similar to the 2020 aerial photograph.	The adjoining properties appear similar to the 2020 aerial photograph. A region of the western surrounding areas has been redeveloped as a residential development and a portion of the northwestern region is in the process of redevelopment. The rest of the surrounding areas appear similar to the 2020 aerial photograph.

Note: See Appendix G for corresponding photographs for 1928 through 2020. The 2023 Google Earth photo is available online and therefore is not included in Appendix G.

8.2 Historical Topographic Maps

Dudek reviewed historical topographic maps from 1894, 1897, 1898, 1904, 1927/1928, 1953, 1966, 1972, 1981, 2012, 2015, and 2018 (Appendix B). Topographic maps from 1925, 1933, and 1939 were provided but were incomplete and did not depict the subject property, adjoining properties, or a majority of the surrounding properties. The topographic maps are a historical source that can be used to document the prior use of the subject property and surrounding area. The topographic maps are described in Table 4.

Table 4. Summary of Topographic Maps

Date	Subject Property	Adjoining and Surrounding Properties
1894	The subject property is depicted as vacant and undeveloped land.	An east–west-trending railroad track is depicted adjoining to the south of the subject property and an east–west-trending road is depicted approximately 480 feet north of the subject property. A forest service administrative area boundary is depicted in the eastern/northeastern surrounding area. A reservoir is depicted in the southeastern surrounding area with a path that leads into the eastern and northeastern surrounding area. A wash is depicted approximately 0.75 miles north of the subject property. Multiple roads and small structures are depicted in the greater surrounding areas.
1897	The subject property is depicted similarly to the 1894 topographic map.	The adjoining and surrounding areas are depicted similarly to the 1894 topographic map.
1898	The subject property is depicted similarly to the 1897 topographic map.	The adjoining and surrounding areas are depicted similarly to the 1897 topographic map.
1904	The subject property is depicted similarly to the 1898 topographic map.	The adjoining and surrounding areas are depicted similarly to the 1898 topographic map.
1927/ 1928	The subject property is depicted similarly to the 1904 topographic map.	A town or city boundary is depicted on the west side of the western-adjoining area. The southern-, eastern-, and northern-adjoining areas are depicted similarly to the 1904 topographic map. An intermittent stream or river is depicted approximately 0.25 miles east of the subject property. Two additional reservoirs are depicted in the eastern and northeastern surrounding areas. An increased number of structures and roads are depicted in the greater surrounding areas, particularly to the west/southwest where commercial- and/or industrial-sized structures are also depicted.
1953	The subject property is depicted similarly to the 1927/1928 topographic map.	The adjoining areas are depicted similarly to the 1927/1928 topographic map. An increased number of structures and road development are depicted in the greater surrounding areas, particularly to the north, east, and south. The eastern/southeastern surrounding area is depicted as a built-up area. Large portions of the greater surrounding areas are depicted as vegetation.
1966	The subject property is depicted as a built-up area that remains vacant and undeveloped.	An east–west-trending road, Edna Place, is depicted adjoining to the north of the subject property. A north–south-trending road, Barranca Avenue, is depicted adjoining to the west of the western-adjoining area. The rest of the adjoining areas are depicted similarly to the 1953 topographic map. Most of the surrounding areas are depicted as built-up areas with a majority of the previously depicted vegetation no longer depicted. A Spreading Grounds is depicted approximately 0.72 miles north of the subject property. An increased number of commercial- and/or industrial-sized structures are depicted in the greater surrounding areas.

Table 4. Summary of Topographic Maps

Date	Subject Property	Adjoining and Surrounding Properties
1972	The subject property is depicted similarly to the 1966 topographic map.	The adjoining areas are depicted similarly to the 1966 topographic map. An increased number of commercial- and/or industrial-sized structures are depicted in the western, northern, and eastern surrounding areas.
1981	The subject property is depicted similarly to the 1972 topographic map.	The adjoining areas are depicted similarly to the 1972 topographic map. An increased number of commercial- and/or industrial-sized structures are depicted in the western and eastern surrounding areas. The rest of the surrounding areas appear similar to the 1972 topographic map.
2012	The subject property is depicted similarly to the 1981 topographic map.	Individual structures and site features are no longer depicted on the topographic map. The only structures or site features still depicted are hospitals and a fire station. The streets depicted are in a similar configuration as present-day roads.
2015	The subject property is depicted similarly to the 2012 topographic map.	School structure features have been added to the surrounding areas. The previously depicted forest service area boundary is depicted again in the eastern/northeastern surrounding area. The rest of the adjoining and surrounding areas are depicted similarly to the 2012 topographic map.
2018	The subject property is depicted similarly to the 2015 topographic map.	The adjoining and surrounding areas are depicted similarly to the 2015 topographic map.

Note: See Appendix B for corresponding maps.

8.3 Fire Insurance Maps

Historical Sanborn fire insurance maps were requested from EDR. Sanborn maps provide information regarding the historical uses of the subject property and surrounding properties. Sanborn maps typically exist for cities with populations of 2,000 or more; the coverage is dependent on the location of the subject site within the city limits. Sanborn fire insurance maps were not found in the database for the subject property and it is considered an unmapped property. The Sanborn Map Report is provided in Appendix H.

8.4 City Directory

City directory listings were requested from EDR (Appendix I). For the city directory review, 522 and 534 East Edna Place were used to identify the subject property. Multiple adjoining or target property addresses were identified in research sources. Findings for the subject property and for adjoining property sites that have a high probability of containing hazardous material are summarized below in Table 5.

8.5 Title Information/Environmental Liens

As discussed in Section 6.2, the user is required to complete a search for environmental liens and AULs to satisfy the requirements of the All Appropriate Inquiries Rule for CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) liability protection. An environmental lien search including available records from 1980 to the present was conducted for the subject property parcels (APNS 8429-008-028 and 8429-008-029) located at the addresses 522 and 534 East Edna Place, Covina, California 91723 (Appendix J).

The current legal owner of APN 8429-008-028, located at 534 East Edna Place, is listed as the Bory Brothers LLC, An Idaho Limited Liability Company. No environmental liens or AULs were identified through the parcel search (Appendix J). A summary of the title information is presented in Table 6a.

Table 6a. Title Information Summary for Assessor's Parcel Number 8429-008-028

Grantee	Grantor	Date	Notes
Bory Brothers, LLC, an Idaho Limited Liability Company	Jacob Bory, Joshua Bory, George Bory, Romona B. Bowling, Trustee of the Joseph C. Bowling Decedent's Trust, Dated January 11, 2003	March 2023	Grant Deed

9 Previous Environmental Site Assessments

No previous environmental assessments were provided to Dudek during this Phase I ESA.

10 Vapor Encroachment

Dudek evaluated vapor encroachment to determine whether there is a potential for vapors originating from contaminated soil and/or groundwater to occur in the subsurface below the existing and potential future on-site structures. Information obtained from other sources (geologic and hydrogeological information, site reconnaissance, local regulatory agency responses), as discussed in this report, was also considered. The vapor encroachment condition (VEC) assessment was conducted in accordance with ASTM Standard E2600-15 guidance (ASTM 2015). The EDR Radius Map Report (Appendix C) was used to evaluate listed contaminated sites as identified in federal, state, and local databases. A VEC assessment report is provided in Appendix K.

No sites were identified as having groundwater contamination or soil vapor contamination that could impact the subject property; as such, no VEC was identified.

11 Non-ASTM Considerations

This section discusses non-ASTM scope considerations that were included in this Phase I ESA based on the conditions at the subject property. These items are not required to be evaluated per the ASTM Standard but may still pose environmental health and safety risks.

Asbestos

Asbestos has been specifically designated a hazardous substance pursuant to CERCLA Section 102, but abatement costs are generally not recoverable under CERCLA. Many building materials commonly contained asbestos until the late 1970s, and a smaller list of building materials contained asbestos in the 1980s, such as drywall, joint compounds, vinyl flooring, roofing, asbestos-cement products, and stucco. Under the Toxic Substances Control Act, the U.S. Environmental Protection Agency banned the use of asbestos in many products, with partial bans occurring in 1989 and 1993. However, a full ban of asbestos products did not occur until 2019. Therefore, if a building was constructed prior to 1989, it is likely to contain asbestos products. If it was constructed between 1989 and 2019, it is less likely asbestos is present, but the potential persists.

The subject property buildings were constructed in 1958 and 1960. Asbestos could be present in the building materials of the subject property buildings. A full asbestos survey should be conducted prior to disturbing any potential asbestos-containing materials.

Lead-Based Paint

Paint manufacturers frequently used lead as a primary paint ingredient through the 1940s and gradually decreased its use in the 1950s and 1960s. The federal department of Housing and Urban Development estimates 30% of homes built in the United States before 1978 contain some lead-based paint. The Consumer Product Safety Commission prohibited the use of lead-based paints in residential buildings in 1978; however, the use of lead-based paints in commercial and industrial buildings is not prohibited.

The subject property buildings were constructed in 1958 and 1960; therefore, lead-based paint is likely present in building materials.

Radon

Radon is a radioactive gas that is produced from the natural decay of uranium, radium, and thorium in soil, rock, and groundwater. When radon becomes trapped in buildings and concentrations accumulate, exposure to radon can be a concern.

The EDR Radius Map Report presents radon test results for the vicinity of the subject property. A total of 63 sites within Los Angeles County were evaluated. The radon concentration at these sites averaged 0.711 picocuries per liter (pCi/L) on the first floor living area and 0.933 pCi/L in the basement. The U.S. Environmental Protection Agency radon zone for Los Angeles County is 2, which corresponds with average expected indoor radon levels between 2 and 4 pCi/L. The federal radon action level is 4 pCi/L.

12 Findings and Conclusions

Information gathered for this report indicated the following:

- The subject property was used for agricultural purposes (orchards) as early as 1928 until sometime before 1954. Historical and agricultural use is generally associated with the use of pesticides and herbicides, which can result in elevated concentrations of chlorinated compounds and metals. However, since the site was graded and redeveloped by 1964, residual chlorinated compounds and metals, if present, were disturbed and redistributed and are therefore unlikely to impact the environmental conditions of the subject property.
- The subject property buildings were constructed in 1958 and 1960 as multi-tenant commercial properties.
- Adjacent properties include commercial/industrial properties, and nearby properties include a mix of residential housing and commercial/industrial properties.

This assessment did not reveal evidence of RECs, HRECs, CRECs, or VECs (significant data gaps are discussed in Section 13.1).

Dudek performed this Phase I ESA of the subject property in conformance with the scope and limitations of ASTM Standard E1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. This report summarizes the research and findings of the Phase I ESA data gaps, which were determined not to be significant and are discussed in Section 13.1.

13 Limitations

13.1 Data Gaps and Data Failures

As defined in ASTM Standard E1527-21, a data failure is a failure to achieve the historical research objective required by the ASTM Standard even after reviewing the standard historical resources that are reasonably ascertainable and likely to be useful. A data failure is a type of data gap.

The following data failures were identified for this Phase I ESA:

- Gaps greater than the 5-year interval required by the ASTM Standard were identified in historical resources between 1898 and 1904, 1904 and 1927, 1928 and 1938, 1938 and 1948, 1954 and 1964, 1983 and 1989, and 1995 and 2005. This constitutes a data failure.

As defined in ASTM Standard E1527-21, a data gap is the lack of or inability to obtain information required by this practice despite good faith efforts. A data gap is considered significant when it affects the ability of the environmental professional to identify RECs.

The following data gaps were identified for this Phase I ESA:

- While there is a gap in historical resources in exceedance of 5-year intervals, current records indicate that the subject property was first developed for commercial use (current configuration) in 1958. As such, this data gap does not limit the environmental professional's ability to identify a REC or hazardous material use on the subject property; therefore, this gap is not significant.
- No response was received from the Los Angeles Regional Water Quality Control Board, City of Covina City Clerk or Planning Division, or the Los Angeles County Agricultural Commissioner/Weights & Measures Department for records requests. Although this is a data gap, based on the site history, available historical and regulatory information, and present-day use, Dudek has determined this data gap is less than significant as it did not limit the ability to identify a REC.
- Access to the interior portions of the buildings was not provided during the site reconnaissance. Several of the subject property tenants were listed in databases that document hazardous materials and waste storage. Dudek was not able to verify the materials stored or their conditions. As such, this is considered a significant data gap.

Should information be obtained following submittal of this Phase I ESA report that resolves the data gaps and changes the findings of the Phase I ESA report, Dudek will submit the findings to the user in an addendum.

13.2 Report Limitations

The findings and conclusions presented in this report are professional opinions based solely on the indicated data described in this report, as reflected in the discussion in this report of the visual observations of the subject property and vicinity and documentation reviewed and, based on the foregoing, our interpretation of this information and these documents. Dudek makes no warranty, guarantee, or representation, express or implied, as to statements made by

others or information included in documentation reviewed or otherwise provided to Dudek, as described in this report. This report does not purport to identify or describe all potential contamination or other issues related to the environment respecting the subject property and/or the vicinity. Likewise, it is understood that it is possible that conditions or contamination exist at the subject property or in the vicinity that are not identified in this Phase I ESA.

No warranties, guarantees, or representations, expressed or implied, are made by Dudek, except for the representation that this report has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professionals performing the same or similar services in the same or similar geographical locality. This report, including its conclusions and/or recommendations, is intended exclusively and solely for the purpose outlined herein and for the client identified hereunder. This report may not be relied upon by any other person or entity without the express advance written consent of Dudek specifically identifying such person or entity. Dudek reserves the right to further condition any such third-party use based on matters it deems appropriate under the circumstances, in its sole discretion.

This report is subject to the conditions and restrictions and limitations described in ASTM Standard E1527-21.

In accordance with Section 4.6.1 of ASTM Standard E1527-21, this Phase I ESA is valid as a general matter for not longer than 180 days from the date of the first interview, first review of government records, or first visual inspection. If this Phase I ESA has been prepared for the purposes of a transaction, the report must have been completed no more than 180 days prior to the transaction date to be considered viable. Otherwise, the report must be updated or revised in accordance with ASTM Standard E1527-21.

EDR Historical Topo Map Report

06/16/23

Site Name:

Covina Reliability Project
522 and 534 East Edna Place
Covina, CA 91723
EDR Inquiry # 7366478.4

Client Name:

DUDEK
605 Third Street
Encinitas, CA 92024
Contact: Susan Smith

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by DUDEK were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# 14182.06

Project: Covina Reliability Project

Coordinates:

Latitude:	34.092571 34° 5' 33" North
Longitude:	-117.880348 -117° 52' 49" West
UTM Zone:	Zone 11 North
UTM X Meters:	418788.87
UTM Y Meters:	3772769.88
Elevation:	595.00' above sea level

Maps Provided:

2018	1933
2015	1927, 1928
2012	1925
1981	1904
1972	1898
1966	1897
1953, 1954	1894
1939

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/26/2023 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/06/2023 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/06/2023 has revealed that there are 14 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal

Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/23/2023 has revealed that there are 6 ENVIROSTOR sites within approximately 1 mile of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are

11 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/06/2023 has revealed that there are 59 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 02/02/2023 has revealed that there is 1 FINDS site within approximately 0.001 miles of the target property.

PFAS ECHO: Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

A review of the PFAS ECHO list, as provided by EDR, and dated 03/30/2023 has revealed that there is 1 PFAS ECHO site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2021 has revealed that there are 3 HAZNET sites within approximately 0.001 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
SO CAL GAS/COVINA MG	222 WEST EDNA PLACE	W 1/2 - 1 (0.716 mi.)	W164	741

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 7 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and

operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Citation:	HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description:	Failure to provide the following training to all oil-handling personnel: 1. Operation and maintenance of equipment to prevent discharges. 2. Discharge procedure protocols. 3. Applicable pollution control laws, rules, and regulations. 4. General facility operations. 5. Contents of the SPCC Plan.
Violation Notes:	Returned to compliance on 02/08/2017. OBSERVATION: Failure to provide training regarding one or more of the following: 1. The operation and maintenance of equipment to prevent discharges. 2. Discharge procedure protocols. 3. Applicable pollution control laws, rules, and regulations. 4. General facility operations. AND 5. The contents of the SPCC Plan. No SPCC training documents available for on site personnel. CORRECTIVE ACTION: Provide training in: 1. The operation and maintenance of equipment to prevent discharges. 2. Discharge procedure protocols. 3. Applicable pollution control laws, rules, and regulations. 4. General facility operations. AND 5. The contents of the SPCC Plan.

Citation:	HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description:	Failure to comply with one or more of the following requirements: 1. Have record of inspections and integrity tests signed by the appropriate supervisor or inspector. 2. Keep written procedures and records of inspections and integrity tests for at least three years. 3. Keep comparison records.
Violation Notes:	Returned to compliance on 02/08/2017. OBSERVATION: Failure to comply with all of the following requirements: 1. Failure to conduct inspections and tests in accordance with written procedures that you or a certifying engineer have developed for the facility. 2. Failure to sign written procedures and/or a record of inspections and/or customary business records by the appropriate supervisor or inspector. 3. Failure to keep written procedures and/or a record of inspections and/or customary business records with the plan. AND 4. Failure to maintain written procedures and/or a record of inspections and/or customary business records for three years. Inspection records do not detail the required information and procedures as detailed in the SPCC plan. CORRECTIVE ACTION: Conduct tests/inspections in accordance with written procedures and maintain records for 3 years.

Violation Date: 02-11-2014
Citation: HSC 6.95 25505(a) - California Health and Safety Code, Chapter 6.95, Section(s) 25505(a)
Violation Description: Owner/Operator failed to complete and/or submit a Hazardous Materials Business Plan when storing hazardous materials at or above the thresholds quantities of 55 gallons/500 lbs/200 cubic feet.
Violation Notes: Returned to compliance on 06/09/2014.

ASSOCIATED AUTO AIR RADIATOR (Continued) **S100930105**

Violation Division: Los Angeles County Fire Department
Violation Program: HMRRP
Violation Source: CERS,

Site ID: 93684
Site Name: ASSOCIATED AUTO AIR RADIATOR
Violation Date: 11-28-2022
Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Description: Failure to establish and electronically submit an adequate emergency response plan and procedures for a release or threatened release of a hazardous material.
Violation Notes: Returned to compliance on 12/22/2022. OBSERVATION: The business failed to establish and electronically submit adequate emergency response procedures for a release or threatened release of a hazardous material. The emergency response plan submitted in CERS was certified by previous owner Steve hart. CORRECTIVE ACTION: Submit in CERS an emergency response plan certified by current owner.
Violation Division: Los Angeles County Fire Department
Violation Program: HMRRP
Violation Source: CERS,

Site ID: 93684
Site Name: ASSOCIATED AUTO AIR RADIATOR
Violation Date: 11-28-2022
Citation: 22 CCR 12 66262.12 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.12
Violation Description: Failure to obtain an Identification Number prior to treating, storing, disposing of, transporting or offering for transportation any hazardous waste.
Violation Notes: Returned to compliance on 12/22/2022. OBSERVATION: The generator has not obtained an Identification Number to manage hazardous waste. A hazardous waste generator shall not treat, store, dispose of, transport or offer for transportation, hazardous waste without obtaining an Identification Number. EPA ID number CAL00016942 is registered to the previous owner Steve Hart as an individual. CORRECTIVE ACTION: Obtain an EPA ID number for Associated Auto Radiator Inc. as the legal business owner. Submit documentation to the CUPA demonstrating that you have obtained an Identification Number.
Violation Division: Los Angeles County Fire Department
Violation Program: HW
Violation Source: CERS,

Site ID: 93684
Site Name: ASSOCIATED AUTO AIR RADIATOR
Violation Date: 11-28-2022
Citation: HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Description: Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.

ASSOCIATED AUTO AIR RADIATOR (Continued) **S100930105**

Violation Notes: Returned to compliance on 12/22/2022. OBSERVATION: Observed 2 x 15-gallon drums of waste solvent without hazardous waste label and accumulation start date. Owner/Operator is a small quantity generator and failed to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles), or has failed to comply with the conditions of CCR 66262.34(d) and has stored hazardous waste over 90 days. CORRECTIVE ACTION: Dispose of hazardous waste that has been stored over the applicable time limit and provide documentation that the violation has been corrected.
Violation Division: Los Angeles County Fire Department
Violation Program: HW
Violation Source: CERS,

Site ID: 93684
Site Name: ASSOCIATED AUTO AIR RADIATOR
Violation Date: 05-08-2017
Citation: 22 CCR 12 66262.40(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(a)
Violation Description: Failure to keep a copy of each properly signed manifest for at least three years from the date the waste was accepted by the initial transporter. The manifest signed at the time the waste was accepted for transport shall be kept until receiving a signed copy from the designated facility which received the waste.
Violation Notes: Returned to compliance on 05/24/2017. OBSERVATION: Uniform Hazardous Waste Manifests for used coolant and sludge were not available at the time of inspection. CORRECTIVE ACTION: Locate a copy of all manifests for used coolant and sludge and submit copies to the CUPA.
Violation Division: Los Angeles County Fire Department
Violation Program: HW
Violation Source: CERS,

Site ID: 93684
Site Name: ASSOCIATED AUTO AIR RADIATOR
Violation Date: 11-28-2022
Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Description: Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes: Returned to compliance on 12/22/2022. OBSERVATION: The business failed to electronically submit complete and accurate chemical inventory information for all hazardous materials on site at or above reportable quantities in CERS. CORRECTIVE ACTION: Electronically submit complete and accurate chemical inventory information for all hazardous materials on site at or above reportable quantities. Add the 175-gallon of Automatic Transmission Fluid observed during inspection.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Citation:	HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description:	Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes:	Returned to compliance on 05/28/2019. OBSERVATION: The business failed to complete and electronically submit chemical inventory information for all reportable hazardous materials on site at or above reportable quantities. CORRECTIVE ACTION: In CERS, complete and electronically submit the chemical inventory information for all reportable hazardous materials on site at or above reportable quantities. Include ATF, DEF, Solvent and propane. Under Motor Oil, indicate the accurate average daily amount and maximum daily amount. Include all 55-gallon drums, 250-gallon totes, quartz size and 1-gallon size of motor oil in your calculations.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.
